Executive Summary

Introduction

The Healthcare Association of Hawaii and its member hospitals are pleased to present the 2012-2013 State of Hawaii Community Health Needs Assessment (CHNA). This CHNA report was developed through a collaborative process and provides an overview of the health needs in Hawaii. The goal of this report is to offer a meaningful understanding of the health needs in the community, as well as help guide the hospitals in their community benefit planning efforts and development of an implementation strategy to address prioritized needs. Special attention has been given to identify health disparities, the needs of vulnerable populations, and unmet health needs or gaps in services. Although this report focuses on needs within the community, there are innumerable community assets and a true *aloha* spirit that provide ample foundation for community health improvement activities.

Approach

In Fall 2012, the Healthcare Association of Hawaii partnered with Healthy Communities Institute to conduct a CHNA for Hawaii. Our approach followed the public health model of assessing and understanding community health holistically. A framework for analysis was constructed based on determinants of health; the framework included a broad definition of community health that considers extensive secondary data on the social, economic, and physical environments, as well as health risks and outcomes. The influence of *mauka* ("toward the mountains"), or upstream factors, and the resulting *makai* ("toward the ocean"), or downstream impacts, on health is a transcending theme. Key informant interviews with those having special knowledge of health needs, health disparities, and vulnerable populations provided vital information that increased the understanding of the health needs in Hawaii. A small set of community residents provided additional insights on the health needs in Hawaii. It is hoped that this report will provide a foundation for community health improvement efforts and that community health partners will build on this report.

Data Sources and Methods

An extensive array of secondary and primary data was collected and synthesized for this report.

Core Indicators: Secondary data was analyzed using Hawaii Health Matters (www.HawaiiHealthMatters.org), a publicly available data platform with a dashboard of over 140 indicators from over 20 sources; much of the data comes from Hawaii Department of Health, allowing for Hawaii-specific race, age and gender details. This extensive core data was analyzed using a highly systematic and quantitative approach that incorporated multiple benchmarks and comparisons to understand the question: How is Hawaii performing?

Hospitalization Indicators: Eighteen indicators on key preventable causes of hospitalization, analyzed at the county level, supplemented the core indicators. This data was provided by Hawaii Health Information Corporation (HHIC) and enabled valuable insights into utilization patterns, geographic disparities in hospitalization rates, and enhanced the core indicator data for important topic areas.

Supplemental Information: Recently published reports on Hawaii's health and access to care were reviewed for additional key information on important topics such as health disparities, primary care needs, and mental health.

Key Informant Interviews: Storyline Consulting, a local partner of the project, interviewed 22 key informants who had knowledge of the health needs in Hawaii. The selection of the key informants was guided by preliminary core indicator data findings and followed a structured nomination and selection

process by the HAH Advisory Committee. These 22 interviews were supplemented by relevant information provided by additional key informants who were interviewed for the County of Honolulu and had knowledge deemed applicable to the whole state. The input by local key informants was invaluable and greatly enhanced the understanding of health needs and offered insight into health resources and health improvement approaches.

Community Survey: A small sample of community residents, via an online survey, supplemented the key informant interviews. Highlights of these surveys, or “Voices from the Community,” are incorporated throughout the report.

Areas of Need

This report provides an overview of Hawaii community health needs. Community health was assessed for Hawaii as a whole, for race sub-groups, and for sub-geographies. The findings revealed overall or sub-population community needs in the following areas:

Access to Health Services	Exercise, Nutrition, & Weight	Mental Health & Mental
Cancer	Family Planning	Disorders
Diabetes	Heart Disease & Stroke	Older Adults & Aging
Disabilities	Immunizations & Infectious	Oral Health
Economy	Diseases	Respiratory Diseases
Education	Injury Prevention & Safety	Social Environment
Environment	Maternal, Fetal & Infant	Substance Abuse & Lifestyle
	Health	Transportation

Several overarching themes emerged across the topic areas:

All groups experience adverse health outcomes due to chronic disease and health risk behaviors

Individuals from all geographies, race, gender, and age groups experience poor health outcomes. Evidence from high rates of chronic disease patterns, hospitalizations due to preventable causes, and patterns of unhealthy behaviors compels those seeking to improve health to consider interventions at the structural, policy, and community-wide level in order to positively impact the long term health of as many Hawaii residents as possible. A societal shift toward healthier lifestyles that includes quality nutrition, daily physical activity, optimal weight control, social support and reduced substance abuse can have profound positive impacts on Hawaii’s health. Special consideration for mental health, a chronic condition that significantly influences overall health, is critical for achieving population health goals.

Greater socio-economic need and health impacts are found among certain groups and places in Hawaii

There are areas of high socio-economic need across all counties, especially on the Big Island of Hawaii. Disparities in educational attainment are also found across Hawaii, with Native Hawaiians, Pacific Islanders, and Filipino populations most impacted. These areas and groups with high socio-economic need are also the most affected by health problems, as evidenced by significantly worse health outcome measures, higher hospitalization rates, inadequate vaccination rates, and myriad health challenges described by key informants. While Hawaii has relatively good health insurance coverage, some essential health needs remain inaccessible to many, including full spectrum mental health services and quality long-term care for older adults. Hawaii residents with a disability are also more likely to live in poverty than the general population, which puts them at further disadvantage to accessing needed care

and services. When planning for health improvement, careful consideration should be given to highest need groups identified geographically by socio-economic measures.

Cultural and language barriers inhibit effective intervention for the most impacted populations

Because of the strong correlation between poverty and race/ethnicity, some of the groups most impacted by health issues often face cultural barriers to health improvement. Language differences, including limited English proficiency, and poor health behaviors that are common within a culture are challenges that must be overcome in order to effectively prevent disease.

Limited access to care results in greater health impacts

Access to health care is challenging on the Neighbor Islands and rural parts of Oahu due to shortages of primary and specialty care, as well as transportation issues for those in rural areas who need to obtain care in Honolulu. Access challenges also exist for those who are underinsured, those with cultural differences, and those with complicated needs. Federally designated underserved areas and populations cover the entirety of the Neighbor Islands and part of Oahu. Unmet mental health, oral health, and chronic disease management needs are recurring themes supported by data and key informant interviews. Addressing the medical and dental shortage areas and increasing access to primary, specialty and long-term care are important needs in Hawaii.

Community health centers and schools are key community assets for effective interventions

Key informants highlighted the primary assets of community health centers and schools as venues that can provide culturally appropriate services and education that promotes health lifestyles and health literacy. Community-based clinics and schools can address “human needs” in an integrated manner. Children spend the majority of their waking hours in schools and one of the best chances for improving the health of the next generation is through school-based programs. While Hawaii has many existing community health centers, funding is often a limitation of providing services through these venues. Public schools also have funding challenges that impact their ability to meet the spectrum of student needs.

Hawaii is rich with organizations, agencies, and individuals that understand the impact of social determinants of health and seek opportunities to partner or collaborate to improve the health of the community. Fortunately, the *aloha* spirit in Hawaii embodies concern for community and is deeply infused in the culture of Hawaii.

Selected Priority Areas

Straub Clinic and Hospital has selected the following two priorities:

1. Access to Health Services
2. Heart Disease & Stroke

Details about the prioritization process can be found in Section 5.

Note to the Reader

Beyond the Executive Summary, readers may choose to study the entire report or alternatively focus on a particular topic area. An overview is provided for each key type of data included in the report: core indicators, hospitalization rates, key informant interviews, and on-line community survey.

To more deeply understand a topic area, the reader can turn to any of the 20 topic area presentations and find all data for the topic and summary conclusions. Each topic-specific section is organized in the following way:

- Core Indicators and Supplemental Information
- Hospitalization Rates (when available)
- Key Informant Interview Information
- Summary of Topic Area

1 Introduction

1.1 Summary of CHNA Report Objectives and context

The state of Hawaii is unique in that all of its community hospitals and hospital systems joined efforts to fulfill new requirements under the Affordable Care Act, which the IRS developed guidelines to implement. The Healthcare Association of Hawaii (HAH) led this collaboration to conduct state- and county-wide assessments for its members.

1.1.1 Healthcare Association of Hawaii

HAH is the unifying voice of Hawaii's health care providers and an authoritative and respected leader in shaping Hawaii's health care policy. Founded in 1939, HAH represents the state's hospitals, nursing facilities, home health agencies, hospices, durable medical equipment suppliers, and other health care providers who employ about 20,000 people in Hawaii. HAH works with committed partners and stakeholders to establish a more equitable, sustainable health care system driven to improve quality, efficiency, and effectiveness for patients and communities.

1.1.2 Member Hospitals

Twenty-six of 28 Hawaii hospitals,¹ located on all islands, participated in the CHNA project:

[Castle Medical Center](#)
[Hale Ho`ola Hamakua](#)
[Hilo Medical Center](#)
[Kahi Mohala Behavioral Health](#)
[Kahuku Medical Center](#)
[Kaiser Permanente Medical Center](#)
[Kapi`olani Medical Center for Women & Children](#)
[Ka`u Hospital](#)
[Kauai Veterans Memorial Hospital](#)
[Kohala Hospital](#)
[Kona Community Hospital](#)
[Kuakini Medical Center](#)
[Kula Hospital](#)
[Lana`i Community Hospital](#)
[Leahi Hospital](#)
[Maui Memorial Medical Center](#)
[Molokai General Hospital](#)
[North Hawaii Community Hospital](#)
[Pali Momi Medical Center](#)
[Rehabilitation Hospital of the Pacific](#)
[Samuel Mahelona Memorial Hospital](#)
[Shriners Hospitals for Children - Honolulu](#)
[Straub Clinic & Hospital](#)
[The Queen's Medical Center](#)

* Tripler Army Medical Center and the Hawaii State Hospital are not subject to the IRS CHNA requirement and were not a part of this initiative.

[Wahiawa General Hospital](#)

[Wilcox Memorial Hospital](#)

1.1.3 Advisory Committee

The CHNA process has been informed by hospital leaders and other key stakeholders from the community who constitute the Advisory Committee. The following individuals shared their insights and knowledge about health care, public health, and their respective communities as part of this group.

Howard Ainsley - Hawaii Health Systems Corporation
Bruce Anderson, PhD – Hawaii Health Systems Corporation
Joy Barua – Kaiser Permanente Hawaii
Maile Ballesteros – St. Francis Home Care Kauai
Wendi Barber, CPA, MBA – Castle Medical Center
Rose Choy - Kahi Mohala Behavioral Health
Kathleen Deknis, RN, MPH – Home Health by Hale Makua
Karen Fernandez – Wahiawa General Hospital
Mark Forman, JD – Hawaii Medical Service Association Foundation
Loretta J. Fuddy, ACSW, MPH – State of Hawaii Department of Health
Robert Hirokawa, DrPH – Hawaii Primary Care Association
Mari-Jo Hokama – Kahi Mohala Behavioral Health
Fred Horwitz – Life Care Center of Hilo
Susan Hunt, MHA – Hawaii Island Beacon Community
Richard Keene – The Queen’s Health Systems
Jeannette Kojane, MPH – Kokua Mau
Jay Kreuzer - Hawaii Health Systems Corporation
Greg LaGoy, ND, MBA – Hospice Maui
Bernadette Ledesma, MPH – Pearl City Nursing Home
Vince Lee, ACSW, MPH - Hawaii Health Systems Corporation
Wesley Lo - Hawaii Health Systems Corporation
Pat Miyasawa – Shriners Hospitals for Children-Honolulu
R. Don Olden – Wahiawa General Hospital
Quin Ogawa – Kuakini Health System
Jason Paret, MBA – North Hawaii Community Hospital
Ginny Pressler, MD, MBA, FACS – Hawaii Pacific Health
Hilton Raethel, MBA, MHA – Hawaii Medical Service Association
Hardy Spoehr - Papa Ola Lokahi
Jerry Walker - Hawaii Health Systems Corporation
Katherine Werner Ciano, MS, RN – North Hawaii Hospice
Ken Zeri, RN, MSN – Hospice Hawai'i
Lori Miller – Kauai Hospice
Marie Ruhland, RN – Home Healthcare Services of Hilo Medical Center
Neill Schultz – Castle Medical Center
Corinne Suzuka, RN, BNS, MA – St. Francis Home Care
Peter Sybinsky, PhD – Hawaii Health Information Corporation
Ty Tomimoto – Rehabilitation Hospital of the Pacific
Sharlene Tsuda – The Queen’s Health Systems
Stephany Vaioleti, LSW, JD - Kahuku Medical Center

Sharon Vitousek, MD – North Hawaii Outcomes Project

1.1.4 Consultants

Healthy Communities Institute

The Healthy Communities Institute (HCI) mission is to improve the health, environmental sustainability and economic vitality of cities, counties and communities worldwide. The company is rooted in work started in 2002 in concert with the Healthy Cities Movement at the University of California at Berkeley.

HCI offers a spectrum of technology and services to support community health improvement. HCI's web-based dashboard system makes data easy to understand and visualize. The web system and services enable planners and community stakeholders to understand all types and sources of data, and then take concrete action to improve target areas of interest. HCI has over 100 implementations of its dashboard for clients in 40+ states.

The HCI team is composed of experts in public health, health informatics, and health policy. The services team provides customized research, analysis, convening, planning and report writing to meet the organizational goals of health departments, hospitals, and community organizations.

To learn more about Healthy Communities Institute please visit www.HealthyCommunitiesInstitute.com.

Storyline Consulting

Storyline Consulting is dedicated to serving and enhancing Hawaii's nonprofit and public sectors. Storyline provides planning, research, evaluation, grant writing, and other organizational development support and guidance. By gathering and presenting data and testimonies in a clear and effective way, Storyline helps organizations to improve decision-making, illustrate impact, and increase resources.

To learn more about Storyline Consulting please visit www.StorylineConsulting.com.

1.2 Hospital Community Benefit Team and Goals

Straub Clinic and Hospital established an internal community benefit team composed of nine staff members to develop the Implementation Strategy and support the hospital's community health improvement plans. The team consists of:

- Chief Executive Officer
- Chief Medical Officer
- Director of Quality & Safety
- Manager of Health Management
- Director of Risk Management
- Director of Financial Planning
- Director of Business Operations
- Vice President of Operations/Chief Nurse Executive
- Vice President of Clinic Operations

This newly formed team's goal is to continue to refine and expand the impact of the hospital's community benefit activities. The Community Benefit team has access to and a reporting relationship with the Straub Clinic and Hospital and Hawaii Pacific Health Boards of Directors.

Straub Clinic and Hospital contracted with Healthy Communities Institute to work with the hospital community benefit team to develop the Implementation Strategy.

1.2.1 Definition of Community + Map

The hospital service area is defined by a geographical boundary of the State of Hawaii. The state will serve as the unit of analysis for this Community Health Needs Assessment. Hence, the health needs discussed in this assessment will pertain to individuals living within this geographic boundary. When possible, highlights for sub-geographies within Hawaii are provided. The specific area served by Straub Clinic and Hospital is indicated in **Error! Reference source not found.**.

2 Methods

The starting point for this needs assessment is a summary of secondary or core indicator data, which applies a systematic and quantitative method of comparing the relative severity of health indicators across 20 topic areas. When possible, other data are considered, including rates of hospitalization due to preventable causes, to more closely examine the most severe health needs and their impact on health care utilization. The secondary data findings are further informed by collected primary data. Individuals with special knowledge regarding the health needs of the community, including those with expertise in public health and community health, were interviewed through a key informant interview process. An online survey collected additional opinions from community residents. The quantitative, secondary data is then combined with the knowledge of key informants who have awareness of health needs specific to their community and highlighted with resident opinions on community health concerns.

2.1 Core Indicator Summary

2.1.1 Data Sources

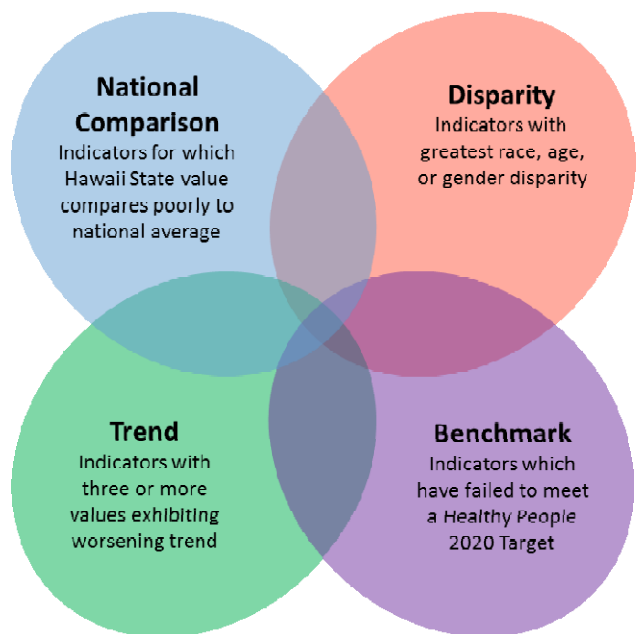

The core indicators included in this summary originated from Hawaii Health Matters (www.HawaiiHealthMatters.org), a publicly available data platform with a dashboard of over 140 indicators from over 20 sources. Hawaii Health Matters (HHM) was developed as a partnership between Hawaii Health Data Warehouse and Hawaii Department of Health, with technology provided by Healthy Communities Institute. The core indicators cover health outcomes, behaviors that contribute to health, and other factors that are correlated with health. The secondary data available on HHM is continuously updated as sources release new data. The data included in this summary is as of October 17, 2012, and may not reflect data currently on the site. Additional data specific to race, gender, and age subgroups was obtained directly from Hawaii Department of Health. Each of the indicators was categorized into one of 20 topic areas, spanning both health and quality of life issues. All indicators, including measurement date, sources and topic area assignment, are included in the Appendix of this report.

2.1.2 Comparisons: Analytic Approach

The status of Hawaii was assessed one indicator at a time using up to four comparison methods.

1. First, Hawaii was compared geographically, to the rest of the United States. If the indicator value for Hawaii was worse than the U.S. average, or if Hawaii was in the worst 50th percentile of U.S. state values, then Hawaii was considered to compare poorly to the nation.
2. The second comparison examined the trend of the data. A line of best fit was calculated for all available data points, and the slope of the line was used to determine the average percent change per year. If Hawaii's indicator value had worsened by at least 2.5% of the baseline value per year, the trend for the indicator was considered poor.
3. A third comparison measured disparities among sub-populations in Hawaii. If one sub-population had a value at least four times worse than another for the indicator, then the disparity measurement was considered poor.
4. Finally, the indicator value was compared to nationally recognized Healthy People 2020 (HP2020) benchmarks. The comparison was considered poor if Hawaii had not yet met the target set by the U.S. Department of Health and Human Services (see Appendix A for more information on HP2020 benchmarks).

Figure 2.1: Comparison Methods

As many comparisons as possible were applied to each indicator. The possible comparisons varied for each indicator depending on the availability of data. Geographic comparisons were only possible when national data was available for the same indicator and time period. Trend comparisons were only possible when at least three periods of measure were available to avoid misinterpreting slight changes between two periods. The availability of sub-population data varied by indicator, and so disparity comparisons were incorporated whenever possible. Finally, HP2020 benchmarks only exist for a subset of the indicators included in the summary. Please see Appendix A for more details and examples of this process.

2.1.3 Indicator and Topic Area Scoring

After the status of all possible comparisons was assessed, indicators were aggregated into their respective topic areas. The total number of poor comparisons was divided by the total possible comparisons within the topic area to calculate the topic area score. This score, measuring the proportion of poor comparisons within the topic, ranges from zero to one. Scores were not calculated for topic areas that had one or zero indicators, as these areas were deemed to lack an adequate number of indicators. The top ten topic areas with the highest scores were used to guide primary data collection. Please see Appendix A for more details and an example of this process.

2.1.4 Shortage Area Maps

Core indicator data for relevant topic areas was supplemented with maps illustrating the following types of federally-designated shortage areas and populations:

- Medically underserved areas and/or populations
- Primary care health professional shortage areas and/or populations
- Mental health professional shortage areas and/or populations
- Dental health professional shortage areas and/or populations

Criteria for medically underserved areas and populations can be found at:

<http://bhpr.hrsa.gov/shortage/muaps/index.html>

Criteria for health professional shortage areas can be found at:

<http://bhpr.hrsa.gov/shortage/hpsas/designationcriteria/designationcriteria.html>

Maps of shortage areas and populations were based upon shapes generated using the Community Issues Management site's mapping tool: <http://www.cim-network.org/CIM/Tools/>

Maps were further customized by Healthy Communities Institute.

2.2 Hospitalization Rates

While the Core Indicator Summary included several unadjusted hospitalization rate indicators, further risk-adjusted rates were obtained for comparison between geographies of varying population makeup. Rates were provided by Hawaii Health Information Corporation (HHIC), and are defined by the Agency for Healthcare Research and Quality (AHRQ) as a set of measures that can be used to identify quality of outpatient care, which can potentially prevent the need for hospitalization. Risk adjustment attempts to account for differences in indicators across providers and geographic areas that are attributable to variations in patient mix. AHRQ's risk adjustment methodology employs multivariate ordinary least squares regression to estimate an expected value of each indicator an area would exhibit with an "average" case-mix. The model adjusts for patient demographics, including age, sex, all age-sex combinations, All-Payer Refined DRGs (a refinement of CMS's DRGs that additionally classifies non-Medicare cases) and severity-of-illness. HHIC applies AHRQ's risk adjustment methodology to further control for the top four dominant races in Hawaii, as determined by the Hawaii State Department of Health's Hawaii Health Survey. Risk adjustment coefficients are estimated using the Healthcare Cost and Utilization Project's (HCUP) State Inpatient Databases (SID). Please see http://qualityindicators.ahrq.gov/Modules/pqi_resources.aspx for a complete definition of indicators. Because the area of mental health was not well represented in the Core Indicator Summary, HHIC also provided unadjusted rates of hospitalization for any mental health-related primary diagnosis.

Sub-county hospitalization rates are included for Hospital Service Areas (HSA), which were defined in 1995 by hospital CEOs and are composed of contiguous zip codes surrounding a hospital's self-defined service area. Please see Appendix B for a list of the zip codes contained within each HSA.

Also included in Appendix B are unadjusted rates for age, gender, and race/ethnicity sub-populations. The inclusion of these rates in the Findings discussion is limited due to uncertainties in the comparability of these unadjusted rates with the risk-adjusted rates.

All rates are based upon patient residence, and values were suppressed if there were fewer than 10 cases. Population estimates are based on the U.S. Census Bureau, Population Division, Intercensal Estimates of the Resident Population for Counties of Hawaii and Hawaii State Department of Health, Office of Health Status Monitoring, Hawaii Health Survey. Sub-county demographic counts are based on estimates/projections provided by Pitney Bowes Business Insight, 2008-2011. Population estimates by race were provided by the Hawaii State Department of Health, Office of Health Status Monitoring, Hawaii Health Survey 2009-2010.

Hospitalization rate area maps were created by HCI using HHIC-provided Hospital Service Area maps, where darker shading of Hospital Service Areas reflects higher rates.

2.3 Key Informant Interviews

In order to supplement the quantitative findings, key informants were interviewed to further assess the underlying drivers for health outcomes, current community efforts, and obstacles to health. These key informants were chosen by the HAH Advisory Committee on November 7-8, 2012 through a structured nomination and selection process, which followed a thorough review of the preliminary core indicator data. Advisory members nominated community members with expertise in public health, in the top ten topic areas from the core indicator analysis, as well as in those topic areas where there were data gaps. Key informants were also nominated for their knowledge of vulnerable populations, such as low-income or more adversely impacted racial/ethnic groups. After the nomination process, the advisory members prioritized the list through a voting process.

The key informant interview process was part of a larger statewide CHNA effort in which a total of 105 community experts were nominated, then prioritized down to a list of 75. The remaining 30 nominated key informants were maintained on an alternate list, in the event that a key informant was not available. Roughly 15 key informants were allotted for each of the four counties and for the overall state perspective. 22 key informants were interviewed for their state-wide knowledge of health needs; when certain topic areas were lacking an interview with a state-wide perspective, relevant findings from Honolulu County interviews were included.

The interviews were conducted by local consultants, Storyline Consulting. The interviews took place between November 19, 2012 and January 2, 2013 and lasted 30-60 minutes in length. Most interviews took place by phone; a few took place in person. Storyline Consulting typed notes from the interviews during the conversation, capturing the bulk of the conversation verbatim. Interview notes were then condensed and entered into a data collection spreadsheet.

The information obtained from these interviews was incorporated into this report in three ways. A summary qualitative analysis tool called a “word cloud” was produced using TagCrowd.com to identify the most common themes and topics. Words or phrases that were mentioned most often display in the word cloud in the largest and darkest font (see Figure 3.8). Next, input from the key informants was included in each relevant topic area in Section 3.2. Lastly, any recommended community programs or resources are referenced in Appendix D: Identified Community Resources.

A Key Informant Interview Guide was developed to guide the interviews. Storyline Consulting adapted the interview guide to best suit Hawaii’s context, unique ethnic/racial profile, and culture. The questions used in the guide are listed below:

- Q1: Could you tell me a little bit about yourself, your background, and your organization?
- Q2: You were selected for this interview because of your specialized knowledge in the area of [topic area]. What are the biggest needs or concerns in this area?
- Q3: What is the impact of this health issue on low income, underserved/uninsured persons?
- Q4: Could you speak to the impact on different ethnic groups of this health concern?
- Q5: Could you tell me about some of the strengths and resources in your community that address [topic area]?
- Q6: Are there opportunities for larger collaboration with hospitals and/or the health department that you want us to take note of?
- Q7: What advice do you have for a group developing a community health improvement plan to address these needs?
- Q8: What are the other major health needs/issues you see in the community?
- Q9: Is there anything else you’d like us to note?

2.4 Community Survey

An online survey was used to collect community opinions on the greatest health needs for Hawaii. The survey link was virally distributed by members of the HAH Advisory Committee and was posted on several local websites, including www.HawaiiHealthMatters.org. The survey was open from November 28 to December 24, 2012. Because the survey sample is a convenience sample, it is not expected to be representative of the population as a whole. Survey respondents provided select personal characteristics, including gender, age, sex, county and zip code of residence and whether or not the

resident works in the health field. Residents were asked to rank the top ten topic areas from the core indicator analysis in order of importance for their community, as well as informing us about other topic areas of concern. Respondents were also asked which racial/ethnic groups they felt experienced more health problems than average. Lastly, there was an open-ended question asking the resident if there was anything else they would like to share with us, in terms of health concerns in their community. Opinions gathered with this survey are included in this report as highlights, called “Voices from the Community,” in describing notable areas of need.

3 Community Health Needs Assessment Findings

3.1 Demographics

The demographics of a community significantly impact its health profile. Different ethnic, age, and socioeconomic groups may have unique needs and take varied approaches to health. This section provides an overview of the demographics of the State of Hawaii, with comparisons to the United States for reference. All estimates are sourced from the U.S. Census Bureau's American Community Survey unless otherwise indicated.

3.1.1 Population

In 2011, Hawaii had a population of 1,374,810. As measured by the decennial Census, the population density in the state is much higher than the U.S. overall. Within the state, Hawaii County grew the fastest between 2000 and 2010, while Honolulu County grew the slowest.

Table 3.1: Population Density and Change

	U.S.	Hawaii	Hawaii County	Honolulu County	Kauai County	Maui County
Population, 2011	311,591,919	1,374,810	186,738	963,607	67,701	156,693
Population density in persons per sq. mi, 2010*	87	212	46	1,587	108	133
Population change, 2000-2010*	9.7%	12.3%	24.5%	8.8%	14.8%	20.9%

*2010 U.S. Census

Age

As seen in Figure 3.1, Hawaii's population is slightly older than the rest of the country, with a median age of 38.5 (compared to 37.3 for the U.S.). Children under 18 make up only 22.1% of the state's population, while 23.7% of the total U.S. population is under 18.

Figure 3.1: Population by Age, 2011: Hawaii and U.S.

Within the state, Kauai County has the oldest population with a median age of 42.2. Honolulu County has the youngest, with a median age of 37.6.

Figure 3.2: Population by Age, 2011: Counties in Hawaii

Racial/Ethnic Diversity

Differences are more readily apparent when comparing the race/ethnicity breakdown of Hawaii against the rest of the country. In Figure 3.3, the race groups displayed to the left of the blue line include residents reporting one race only, while residents reporting two or more races and Hispanic/Latino ethnicity (of any race) are shown to the right of this line. The population reporting a race of White only makes up 25.0% of the population, compared to 74.1% in the U.S., almost three times greater. Black/African American, Hispanic/Latino, and Other race/ethnicity groups are also much smaller than the U.S. overall.

Figure 3.3: Population by Race/Ethnicity, 2011

The largest single race group in Hawaii is Asian at 38.1%. The majority of the Asian population is Filipino or Japanese, as seen in Figure 3.4 (which includes all residents reporting a race of Asian only regardless of Hispanic/Latino ethnicity). Hawaii also has much larger Native Hawaiian/Other Pacific Islander (9.3%) and multiracial populations (24.1%) than the rest of the country. Native Hawaiians, at 5.6% of the total population, make up the largest share of the Native Hawaiian/Other Pacific Islander single race group (Figure 3.5).

Figure 3.4: Breakdown of Population Reporting Race of Asian Only, 2011

Figure 3.5: Breakdown of Population Reporting Race of Native Hawaiian/Other P.I. Only, 2011

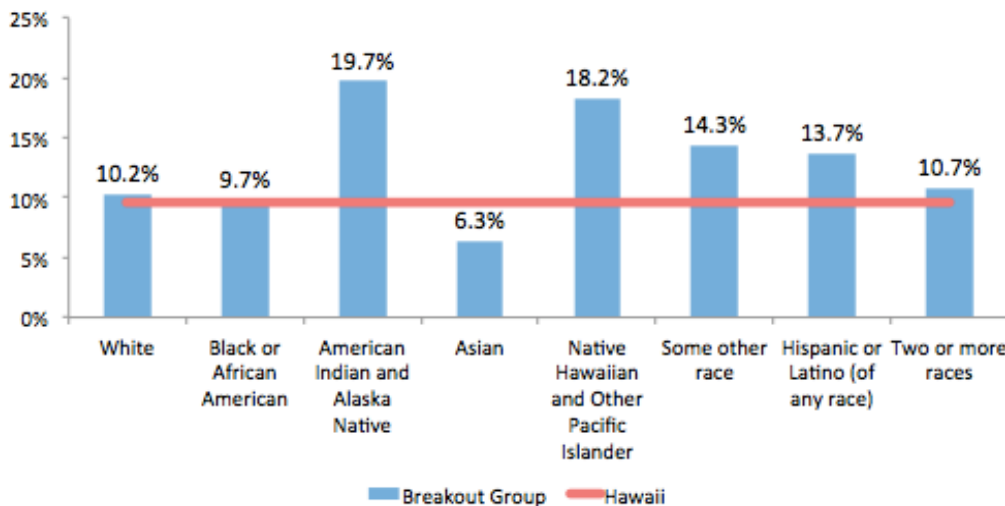

A higher percent of Hawaii is foreign-born compared to the U.S. In 2006-2010, 17.7% of the state was foreign-born, compared to 12.7% of the U.S. overall. A higher percent of Hawaii households were linguistically isolated as well: 6.2% of households reported that all of its members ages 14 and over had some difficulty speaking English, contrasted with just 4.8% of households in the U.S.

3.1.2 Economy

Income in Hawaii overall is high. Median household income in 2006-2010 was \$66,420, substantially higher than the national value of \$51,914. While the gap is smaller among per capita incomes, Hawaii's \$28,882 is still higher than the U.S.'s \$27,334. Hawaii also has a smaller population living in poverty compared to the U.S., at 9.6% vs. 13.8%. Within the state, Honolulu County is tied with Kauai County for the lowest levels of poverty (8.8%). Hawaii County has the highest, at 14.4%. Certain race/ethnicity groups are also more affected by poverty, as seen in Figure 3.6. The American Indian/Alaska Native and Native Hawaiian/Other P.I. populations have the highest poverty rates at 19.7% and 18.2% respectively. The two least impoverished groups are Asian (6.3%) and Black or African American (9.7%). It is important to note that federal definitions of poverty are not geographically adjusted, so the data may not adequately reflect the proportion of Hawaii residents who struggle to provide for themselves due to the high cost of living in the state.

Figure 3.6: Poverty by Race/Ethnicity, 2006-2010

3.1.3 Education

Hawaii residents are well-educated compared to the rest of the nation. In 2006-2010, 89.8% of the state's residents aged 25 and older had at least a high school degree, and 29.4% had at least a bachelor's degree. By contrast, only 85.0% of the nation's 25+ population had a high school degree or higher, and only 27.9% had a bachelor's degree or higher.

3.2 Overview of Needs Assessment

Core Indicator Summary

One hundred forty-six (146) indicators of health drivers and outcomes were included in the systematic review of secondary data. Table 3.2 shows the weighted ranking scores for each topic area, from most severe to least.

Table 3.2: Core Indicator Summary Scores

Topic Area	Indicators	Score	Rank
Heart Disease & Stroke	4	0.71	1
Respiratory Diseases	2	0.60	2
Family Planning	3	0.57	3
Diabetes	2	0.50	4
Substance Abuse & Lifestyle	33	0.43	5
Social Environment	5	0.40	6
Cancer	12	0.39	7
Injury Prevention & Safety	10	0.38	8
Immunizations & Infectious Diseases	9	0.38	8
Mental Health & Mental Disorders	4	0.38	8
Maternal, Fetal & Infant Health	16	0.36	11
Education	3	0.33	12
Environment	2	0.33	12
Exercise, Nutrition, & Weight	15	0.28	14
Economy	12	0.25	15
Access to Health Services	3	0.14	16
Transportation	4	0.13	17
Oral Health	5	0.08	18
Disabilities	1	n/a	n/a
Older Adults & Aging	1	n/a	n/a

The ranking of scores for the topic areas provides a systematic way to assess a large number of indicators across many topic areas. Because the absolute and relative scores are influenced by the number of available inputs for the scoring equation, scoring differences can arise due to availability of data, so **it is important to consider the scores in the context of the primary data and the interrelatedness of many of the topic areas.** Findings of both quantitative and qualitative nature are presented below by topic area, along with a discussion of what can be learned from these results. For a complete list of indicators included in the core indicator summary, see Appendix A.

Hospitalization Rates

Risk-Adjusted hospitalization rates due to preventable causes in Hawaii for the most recent year available, 2011, are presented in Table 3.3. The specific causes of hospitalization with the three highest overall rates are mental health, COPD or asthma in older adults, and heart failure. Prevention Quality Indicator (PQI) Composite Rates are a summary of preventable causes as described in the table

footnote. Specific causes of hospitalization are further discussed in applicable topic areas below. All hospitalization rates are listed in Appendix B.

Table 3.3: Hospitalization Rates due to Preventable Causes in the State of Hawaii, 2011

Preventable Cause	Hospitalizations	Risk-Adjusted Rate per 100,000 (95% CI)
Mental Health*	5180	481.6 (468.5-494.7)
Heart Failure§	2954	267.4 (257.8-277.1)
Bacterial Pneumonia†	2252	205.1 (196.6-213.6)
COPD or Asthma in Older Adults (Ages 40+)§	1930	293.4 (280.3-306.5)
Urinary Tract Infection†	1126	102.7 (96.7-108.7)
Low Birth Weight**	1072	6 (5.6-6.3)
Diabetes Long-Term Complication§	885	82.8 (77.3-88.2)
Dehydration†	720	65.9 (61.1-70.7)
Diabetes Short-Term Complication§	463	43.1 (39.1-47)
Perforated Appendix***	295	23.7 (21-26.4)
Hypertension§	285	26.7 (23.6-29.8)
Rate of Lower-Extremity Amputation§	187	17.4 (14.9-19.9)
Angina Without Procedure§	178	16.7 (14.3-19.2)
Asthma in Younger Adults (Ages 18-39)§	109	25.9 (21-30.7)
Uncontrolled Diabetes§	72	6.8 (5.2-8.3)
Composite Hospitalization Rates		
PQI Composite – Acute Conditions	4098	373.8 (362.4-385.3)
PQI Composite – Chronic Conditions	6996	646.1 (630.9-661.2)
PQI Composite	11093	1019.4 (1000.4-1038.4)

* Rate for this cause is unadjusted
 **Rate is per 100 live births
 ***Rate is per 100 appendicitis admissions
 † Included in Acute Conditions Composite Rate
 § Included in Chronic Conditions Composite Rate

By county, the highest composite rate for preventable hospitalizations in 2011 was in Honolulu County, followed by Kauai.

Figure 3.7: PQI Composite Hospitalization Rates

include both those pertaining to the informants' specific areas of expertise, as well as other issues they see in the community as a whole. Interviews are summarized by the topic area covered by the interviewees' expertise in sections 3.2.1 through 3.2.20.

Figure 3.8: Key Informant Interview Word Cloud

Community Survey

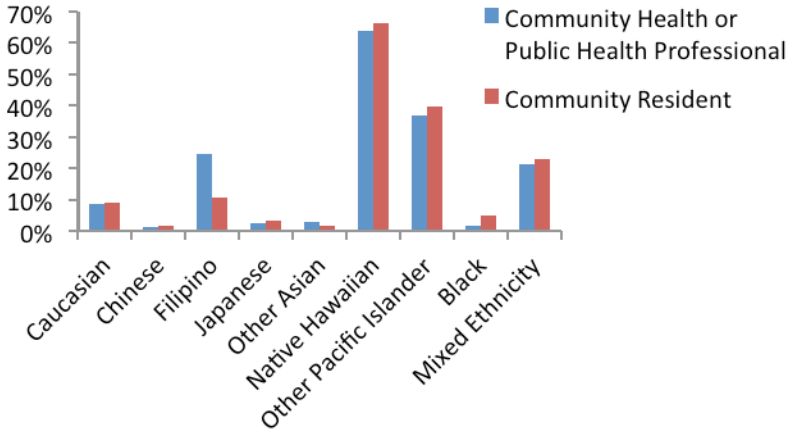

During the period of November 28 to December 24, 2012, 807 surveys were completed online by Hawaii residents. As the survey was a convenience sample, it was not expected to be representative of the state population as a whole. Of the respondents, 73.4% were female, 26.0% male. Over half of respondents were between the ages of 45 and 64; 30.0% were under 45 and 15.0% were 65 or older. More than half of respondents were Community Health or Public Health Professionals (62.0%). The topics to the right are those most commonly noted by respondents as an area of concern for Hawaii, in alphabetical order.

Areas of Concern

- Access to Health Services
- Cancer
- Diabetes
- Economy
- Education
- Exercise, Nutrition, & Weight
- Heart Disease & Stroke
- Immunizations & Infectious Diseases
- Maternal, Fetal & Infant Health
- Mental Health & Mental Disorders
- Older Adults & Aging
- Substance Abuse & Lifestyle

Figure 3.9: High-Risk Race/Ethnicity Groups Identified through Community Survey

In your opinion, which racial or ethnic groups in your community experience more health problems than average?

The race/ethnic group most commonly reported as experiencing more health problems than average was Native Hawaiians, followed by Other Pacific Islanders. Health professionals were more likely than non-health professionals to include Filipino and Other Asian groups as experiencing more health problems than average.

Please see highlights throughout this report of respondent opinions titled “Voices from the Community.”

The sections below, 3.2.1 - 3.2.20, will describe the findings by topic area in the following format:

Core Indicators and Supplemental Information

This section is more extensive for those topics where need demonstrated in the Core Indicator Summary was greatest. The top ten scoring topic areas include a list of highlights followed by a table including the indicators, most recent value, and how Hawaii fared across the four comparison methods. Green checkmarks indicate that the comparison was good, red X’s indicate a poor comparison, and a blank cell indicates no comparison was possible. Further information about core indicators is included in Appendix A. When possible, data is supplemented by additional information obtained from previous needs assessments and reports.

Hospitalization Rates

As applicable, preventable hospitalization rates are compared to values across the State of Hawaii. All hospitalization data for the state and counties are included in Appendix B.

Key Informant Interviews

The information gleaned from key informants who were interviewed for their expertise in the relevant topic area is summarized in a table. Main points made by interviewees are organized by the needs and concerns for Hawaii; the impact on low-income, underserved or uninsured, and/or race or ethnic groups; and the opportunities and strengths that they have identified in their community.

Summary

All findings are summarized for the topic with a focus on common themes.

3.2.1 Access to Health Services

Core Indicators and Supplemental Information

Core indicators for access to health services in Hawaii compare favorably to the U.S. and do not demonstrate any poor trends. Disparities by race and age were not severe enough to be labeled as poor according to the standardized systematic review criteria. However, the health insurance coverage in Hawaii (92.6%) has not met the HP2020 target of 100%.

Voices from the Community

“So many residents do not understand or are [not] able to communicate their health issues.”

Figure 3.10 Federally-Designated Medically Underserved Areas/Populations

Despite the good comparisons in core indicators, a large proportion of Hawaii has been designated as medically underserved by the Health Resources and Services Administration (HRSA). Other than Oahu, the entirety of every island is considered underserved for at least a portion of their populations.

Figure 3.11: Federally-Designated Primary Healthcare Provider Shortage Areas

Furthermore, the Island of Molokai and parts of Maui and Hawaii Islands are considered to be primary care provider shortage areas by HRSA.

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<ul style="list-style-type: none"> *Affordable Care Act focuses primarily on clinical delivery, but the greatest return on investment is in public health interventions *Hawaii has immature delivery system with many small, solo practitioners that need to be supported and not left behind by the ongoing healthcare transformation *Rural areas lack critical care units that can respond quickly; hospitals not equipped to handle array of concerns *More communication among providers; integration of care *More engagement with patients so they are able to manage the complexity of their care with the support of professionals *Conversation about health care and making a better system and affecting more people should be about improving education, decreasing disparities, and really addressing social determinants at the right level 	<ul style="list-style-type: none"> *Med-QUEST has pretty good coverage with no cost sharing for low-income families *Transportation is an issue--how do you get patients to hospitals that have capacity? *Racial/ethnic disparities do exist, but they are confounded by being low-income *Every cultural group has its own attitudes about health and healthcare *Real disparities among Native Hawaiians and Pacific Islanders, who have the worst outcomes *Besides basic health disparities, language barriers, navigation of health system barriers, Compact of Free Association (COFA) nation residents have a lot of access issues because of a "pariah" sense in Hawaii where they are not wanted and disenfranchised 	<ul style="list-style-type: none"> *Increases in reimbursements that begin in 2014 will help improve access to services *Health information technology holds promise, but we need to make sure there are supports for all providers to be able to use it *Participation in marathons, walks, canoe regattas by young kids and whole families demonstrates increased awareness *School-based clinic models have the potential to influence health and wellness starting with the younger generation *Need to support an appropriate presence of community health centers, particularly important for dental and behavioral health *Clearly addressing mental and behavioral health can reduce overutilization rates of ER

Summary

While health insurance coverage in Hawaii is better than the U.S. in general, there are many other barriers to care that make access to health services a complex issue. Availability of services is strongest in Honolulu County, but rural parts of Oahu and neighboring islands struggle to make the array of services needed accessible to everyone where population density is low. Many specialized services, and some primary services, such as mental health services, are not available on each island, requiring costly air transportation to receive care or not receiving the needed care. The race/ethnic groups most in need face both

Voices from the Community

"[We have] limited resources in several health-related areas, such as access to long term care services, lack of or limited specialty care and/or access to these specialty services; [another challenge is] cost of health care in a socio-economic environment that experiences a high unemployment rate with limited resources for employment."

cultural and socioeconomic barriers to engaging with providers to best manage their health. Key informants suggest that local efforts such as school-based clinics and community health centers are best positioned to assist hard-to-reach populations and stress that solo practitioners must be included in current efforts to improve Hawaii's health delivery system.

3.2.2 Cancer

Core Indicators and Supplemental Information

While there are many drivers of cancer, early detection and steps toward prevention can lessen the burden on a community's health. In Hawaii, core indicators reflect a significant need in this area:

Regarding screenings:

- The proportion of women aged 40 and older in Hawaii who have had mammograms within the past two years (76.5%) has not met the HP2020 target (81.1%)
- The proportion of women aged 18 and older who have had a pap test in the past three years (77.4%) has not met the HP2020 target (93.0%)
- The proportion of adults aged 50 and older who have had a blood stool test within the past two years decreased from 43.6% in 2003 to 24.7% in 2010

Regarding new cases and mortality rates:

- Breast cancer incidence (125.1 cases/100,000 females) is in the worst half of US states. The breast cancer death rate is highest for Native Hawaiian/Pacific Islander women (55.1 deaths/100,000 females) and Black or African American women (40.4 deaths/100,000 females)
- Cervical cancer incidence (8.2 cases/100,000 females) is in the worst half of U.S. states, and has increased from 7.6 cases/100,000 females in 2003-2007 to 8.2 in 2005-2009
- Colorectal cancer incidence (48.6 cases/100,000 population) is in the worst half of U.S. states and the colon cancer death rate is highest for Native Hawaiian or Pacific Islanders (39.2 deaths/100,000 population)
- Liver & bile duct cancer incidence (10.7 cases/100,000 population) and melanoma incidence (20.6 cases/100,000 population) are in the worst half of U.S. states; melanoma incidence is highest among Caucasians (65.7 cases/100,000 population)

Table 3.4: Core Indicators – Cancer

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Colon Cancer Screening (2010)	24.7 percent	↘	✗	↘	
Colorectal Cancer Incidence Rate (2005-2009)	48.6 cases/100,000 population	✗	↘	↘	✗
Colon Cancer Death Rate (2009-2011)	13.5 deaths/100,000 population		↘	✗	↘
Liver and Bile Duct Cancer Incidence Rate (2005-2009)	10.7 cases/100,000 population	✗	✗	↘	
Lung and Bronchus Cancer Incidence Rate (2005-2009)	52.9 cases/100,000 population	↘	↘	↘	
Melanoma Incidence Rate (2005-2009)	20.6 cases/100,000 population	✗	✗	✗	
Mammogram History (2010)	76.5 percent	↘	↘	↘	✗
Breast Cancer Incidence Rate (2005-2009)	125.1 cases/100,000 females	✗	↘	↘	
Breast Cancer Death Rate (2009-2011)	14.2 deaths/100,000 females		↘	✗	↘
Pap Test History (2010)	77.4 percent		↘	↘	✗
Cervical Cancer Incidence Rate (2005-2009)	8.2 cases/100,000 females	✗	✗	↘	
Prostate Cancer Incidence Rate (2005-2009)	128.4 cases/100,000 males	↘	↘	↘	

↘ Indicates good comparison, ✗ Indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<p>*Obesity and environmental factors place people at risk, and should be addressed before cancer develops</p> <p>*High cost when found at late stages</p> <p>*Increasing aging population means increased number of people diagnosed with cancer</p>	<p>*Low-income women fall through the gaps with screening</p> <p>*Native Hawaiian, Pacific Islanders, and Filipino groups have poorer health outcomes and the women have higher breast/cervical cancer mortality rates</p> <p>*Higher incidence of cancer in Micronesians exposed to nuclear testing radiation</p> <p>*Cancer treatment centers are concentrated on Oahu and are costly to access from other islands</p>	<p>*Breast and Cervical Cancer Control Program reaches out to groups with higher mortality rates</p> <p>*Micronesians formed tight organizations and sports programs; when youth come out for sports they talk to them about disease and health</p> <p>*Hawaii has progressive policies to curb cigarette smoking and to provide free screening for colon and breast cancer</p> <p>*American Cancer Society program to improve access by picking up patients and taking them to their appointments</p> <p>*American Cancer Society provides materials in Spanish, Tagalog, and Ilocano</p>

Summary

The cancer burden in Hawaii can be reduced with improved screening and preventative behaviors. Cancer screening for women has not met national targets, and colon cancer screening has decreased in recent years. The burden disproportionately falls on certain race/ethnic groups, some of which may be masked in secondary data due to national standards in race categorization that do not well represent Hawaii's population. Reaching these populations for screening and early treatment requires language translation and culturally appropriate communications. Additionally, the concentration of cancer treatment centers on Oahu makes it costly for cancer patients on neighboring islands to access care.

Voices from the Community

Hawaii needs cancer treatment centers [with] equivalent...quality of care and expertise [as] those on the mainland."

3.2.3 Diabetes

Core Indicators and Supplemental Information

Diabetes is an increasing problem in Hawaii:

- The prevalence of diabetes among adults increased from 7.5% in 2003 to 8.3% in 2010
- By age, diabetes prevalence is highest for adults aged 65-74 (18.1%) and 75 or older (17.8%)
- By race, diabetes prevalence is highest for Native Hawaiians (11.4%) and Filipinos (10.1%)

Table 3.5: Core Indicators – Diabetes

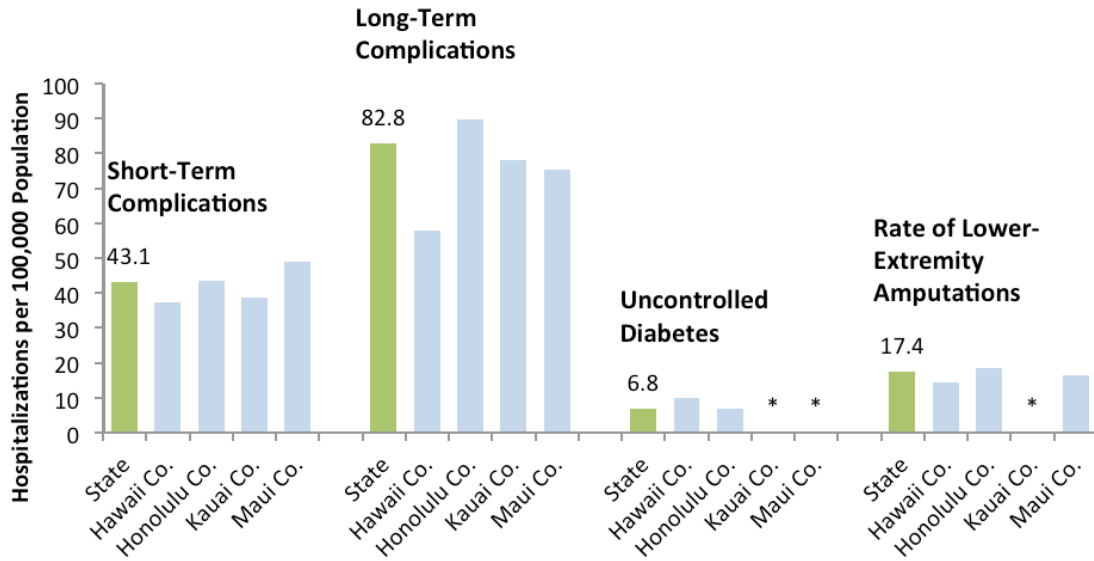

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Adults with Diabetes (2010)	8.3 percent	✓	✗	✗	
New Cases of Diabetes (2010)	5.8 new cases/1,000 population		✓		

✓ indicates good comparison, ✗ indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

Hospitalization Rates

In 2011, the highest rates of hospitalization due to short-term complications of diabetes were in Maui County, the rate due to uncontrolled diabetes was highest in Hawaii County, and rates due to long-term complications and the rate of lower-extremity amputations were highest in Honolulu County.

Figure 3.12: Hospitalization Rates due to Diabetes, 2011

*Suppressed due to low case count

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<p>*National trend is that 1:3 children will have Type II diabetes; in Hawaii, much higher rate of 1:2 children</p> <p>*Childhood obesity will lead to diabetes becoming an even bigger problem in the future; the amount of resources spent on diabetes will double</p> <p>*Diabetes is going undiagnosed in many Hawaii residents</p>	<p>*Native Hawaiians have a higher rate of diabetes, and those living in rural areas have little access to specialists</p> <p>*Higher prevalence for diabetes among Native Hawaiians, other Pacific Islanders, Japanese, and Filipinos and we have such a blend of those bloodlines in Hawaii</p> <p>*Difficulties in translating messages to Samoan and other Pacific Island languages</p> <p>*Outlying areas, low-income population high rates could be lack of overall knowledge of assessment of body and lack of access to critical care</p>	<p>*Work with American Heart and American Cancer Associations to combat obesity</p> <p>*Work with schools to increase physical activity</p> <p>*Ask legislature to put physical education back in schools</p>

Summary

The prevalence of diabetes in Hawaii currently affects a large number of adults and is projected to increase in severity due to childhood obesity. Diabetes' greatest impact is on low-income residents with low access to medical care. Poor disease management leads to more severe disease and inpatient-based care. Reducing the impact of diabetes in Hawaii will require universal and effective primary care management of those with disease, as well as preventing new disease by combatting obesity through a multi-level approach that can effectively include schools, employers, city planning, and community based organizations that promote physical activity across generations.

Voices from the Community

“Diabetes is increasing and there is not a serious educational campaign being done at any level. It should begin in grade school and get children practicing healthier habits and exercising.”

3.2.4 Disabilities

Core Indicators and Supplemental Information

There was no data included in the core indicator summary specific to disabilities (please see Section 4.1.2 for a discussion on data gaps). Based on data from the 2011 American Community Survey, the proportion of persons in Hawaii with a disability (10.6%) is lower than the national average of 12.1%. Among people aged 20 to 64 with a disability, 26.8% were living below poverty in 2011.² The most common type of disability is ambulatory (serious difficulty walking or climbing stairs), as seen in Table 3.6.

Figure 3.13: Percent of Persons with a Disability by Age and Race/Ethnicity: Hawaii, 2011²

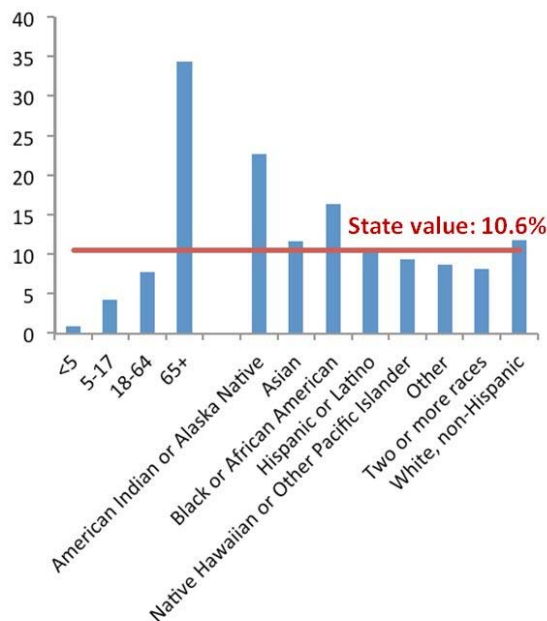

Table 3.6 Percent of Persons with a Disability, 2011²

	Hawaii	U.S.
Persons with a Disability	10.6	12.1
Hearing Difficulty	3.6	3.4
Vision Difficulty	1.7	2.2
Cognitive Difficulty (age 5+)	4.5	4.9
Ambulatory Difficulty (age 5+)	5.9	6.9
Self-Care Difficulty (age 5+)	2.1	2.7
Independent Living Difficulty (age 18+)	5.2	5.8
Children with a Disability	3.3	4.0

Includes all ages unless otherwise noted

One consideration of this needs assessment should be the identification of two priorities for children with special health care needs in a recent statewide needs assessment of Maternal and Child Health Needs³:

- Promote the identification of children with developmental delay
- Promote the transition of adolescents with special health care needs to adult health care

Furthermore, given the large proportion of aging adults 65+ with a disability (34.3%)², the living needs (including housing, transportation, health care, and social support) of the aged and disabled population must be strongly considered in community planning.

Summary

The population of Hawaii with a disability must not be ignored in a needs assessment as their needs may require special attention. Adults with a disability may require special housing, transportation, and health care services. Early identification of needs among children is needed to lessen the burden of disability on their health and wellness, and special focus may be needed to ensure a smooth transition from pediatric to adult health care. Although there are fewer persons living with a disability compared to the nation, a much larger percentage of disabled persons live in poverty in Hawaii compared to the population at large. Socioeconomic constraints put this population at further disadvantage.

² U.S. Census, American Community Survey, 2011 Estimates.

³ From the Family Health Services Division, Hawaii Department of Health Report: *State of Hawaii Maternal & Child Health Needs Assessment Summary*, November 2010. <http://hawaii.gov/health/doc/MCH-NASummary2010>

3.2.5 Economy

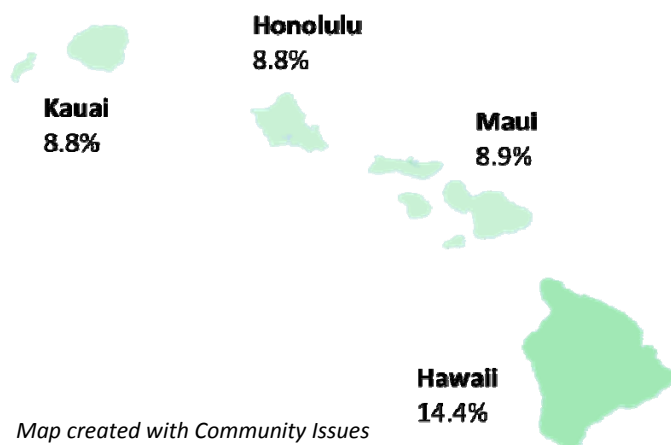

Core Indicators and Supplemental Information

Economic conditions are highly correlated with health. While overall the comparisons for economic core indicators were good for Hawaii, it should be noted that the rate of poverty is high among persons of certain race/ethnic backgrounds. Although the percent of all people living below poverty in Hawaii (9.6%) is in the better half of U.S. state values, the poverty rate for some subpopulations is as high as 19.7% (American Indian and Alaska Natives) and 18.2% (Native Hawaiian and Other Pacific Islanders). Additionally there are three core indicators for which Hawaii falls in the worst quartile of U.S. states: the percentage of households receiving cash public assistance income (3.3%), the homeownership rate (51.2%), and the percentage of renters spending 30% or more of household income on rent (54.6%).

The poverty rate is considerably higher in Hawaii County (14.4%) than the other counties.⁴

A similar pattern is seen in the proportion of children living in households receiving government assistance⁵ (Figure 3.15).

Figure 3.14: Percent of Population Living Below Poverty Level, 2006-2010⁴

Map created with Community Issues Management tool:
<http://www.cim-network.org/CIM/>

Figure 3.15: Percent of Children Living in Households Receiving Government Assistance, 2006-2010⁵

Key Informant Interviews

Although no key informants were interviewed specifically for their knowledge on Hawaii's economy, the effects of poverty on health were mentioned in several interviews spanning many topics. Please see a discussion of the impact of socioeconomics in Section 4.1.

Summary

The economic disparity in Hawaii drives many of the health disparities discussed throughout this report; it is widely understood

⁴ U.S. Census, American Community Survey, 2006-2010 Estimates

⁵ From the Family Health Services Division, Hawaii Department of Health Report: *State of Hawaii Primary Care Needs Assessment Data Book 2012*, July 2012. <http://hawaii.gov/health/doc/pcna2012databook.pdf>

Voices from the Community

“Many of the health issues are linked by common socioeconomic or social determinants. Addressing root causes seems like a way to get on health issues before they become problems like cancer, diabetes, heart disease, etc.”

to be one of the determinants of health, along with education and the social environment. While this topic was not focused on in primary data collection, it was mentioned many times for its relevancy to patterns of health access, health behaviors, and health outcomes. The economy is particularly a concern in Hawaii County, for which secondary data indicates the highest poverty rate. Furthermore, because federal definitions of poverty do not adjust for geographic variations in the cost of living, the data may not adequately reflect the proportion of Hawaii residents who struggle to provide for themselves due to the high cost of living in the state. The necessity of addressing health and quality of life needs among Hawaii's low-income residents is critical in order to realize a healthy community.

3.2.6 Education

Core Indicators and Supplemental Information

Education is a foundation upon which Hawaii residents can work towards economic and social advancement. In Hawaii, the student-to-teacher ratio (15.8 students/teacher) is within the worst half of U.S. states. And there is a large race disparity for education among adults; while 5.3% of all Hawaii residents do not have a high school degree, the rate among adults of Other race is 18.5%, Other Pacific Islanders is 16.8%, Native Hawaiians is 9.8%, and Filipinos is 8.0%.

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<ul style="list-style-type: none"> *High-quality early childhood education is a critical foundation for later success, but many young children are not mentally stimulated enough *Hawaii does not have universal preschool or mandatory kindergarten *Teen dropouts impact not only education but their ability to advocate for themselves around health and wellness 	<ul style="list-style-type: none"> *Challenges for low-income students include nutrition, adequate sleep, and family dynamics that create depression *Teenagers are at risk with alcohol and drug use, chronic diseases like diabetes, and teen pregnancies *Culture is especially important to students who have lost their sense of belonging 	<ul style="list-style-type: none"> *Single most important thing to be done today is establishing an early learning base *Many after-school support systems are in place today, which are incredibly important *Groups are making home visits to dropouts to re-engage them in learning *Should develop village-oriented efforts to share success and accountability with community *Prioritize funding for children

Summary

While educational attainment among adults in Hawaii is better than national averages, a large race disparity reflects that some populations still lack in education. A poor student-to-teacher ratio and a lack of widely available early learning programs for children fuel disparity and prevent low-income children from obtaining a quality education. With support, schools can guide children through special challenges with after school programs and education programs that emphasize students' culture and

Voices from the Community

"[There are] two tiers [of] education for many of the children: excellent if in private school but much less [so] if in public education."

interests. An early start to learning can be supported by financial support for preschool and kindergarten for all children in Hawaii.

3.2.7 Environment

Voices from the Community

"[An important community issue is] managing land development better to control use of drinking water, keep our air clean, avoid beach pollution and preserve endemic plants."

Core Indicators and Supplemental Information

Hawaii's natural environment is a treasured asset. The American Lung Association has given most Hawaii counties grades of "A" or "B" for both annual ozone air quality and annual particle pollution, with the exception of Hawaii County which received a grade of "F" for annual particle pollution in 2008-2010. And although Hawaii has exceeded the HP2020 target for the percentage of beaches that are open and safe for swimming (Target: 96.0%; Hawaii: 99.8%), the percent of beach water samples that contained pathogenic organisms increased from 2% in 2008 to 4% in 2011.

Summary

While the environment did not arise as a great need in core indicators for Hawaii, it should be noted that environmental safety can vary on a more local level for which data is not available. Air and water quality has the strongest health effect on the most vulnerable in the community, including children and older adults. While there may be little that can be done about poor air quality resulting from the volcanic activity on the Big Island, care should be taken to limit the amount of pollution released by humans.

3.2.8 Exercise, Nutrition & Weight

Core Indicators and Supplemental Information

Healthy activity patterns, diet, and weight have profound effects on chronic disease. In the core indicator summary, Hawaii mostly compared favorably to the nation, with the exception of teen fruit and vegetable consumption, which was lower in Hawaii (17.5%) than the U.S. (22.3%). Among adults, fruit and vegetable consumption has generally decreased in recent years (from 27.2% in 2003 to 23.5% in 2009), and the proportion of adults who are obese increased from 16.7% in 2003 to 23.1% in 2010. The adult obesity rate is highest for Native Hawaiians (28.3%), Other race (25.4%), and Other Pacific Islanders (23.8%). Two HP2020 targets are unmet in Hawaii: food insecurity (low access to essential nutrition) among children (Target: 0.2%; Hawaii: 1.1%) and food insecurity among households (Target: 6.0%; Hawaii: 16.6%).

Furthermore, a recent statewide needs assessment of Maternal and Child Health Needs identified reducing the rate of overweight and obesity in young children ages 0-5 as a priority for children in the state.⁶

⁶ From the Family Health Services Division, Hawaii Department of Health Report: *State of Hawaii Maternal & Child Health Needs Assessment Summary*, November 2010. <http://hawaii.gov/health/doc/MCH-NASummary2010>

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<ul style="list-style-type: none"> *Childhood obesity is a widespread problem in Hawaii; affects other things such as hip problems, joint problems, multiple organ systems, and psychological/social issues *Culturally, food is such an important part of our lives in the local Hawaiian culture, and we now have access to so much high calorie, high sugar food *We need to see more physical activity and PE time in schools *Need stronger campus compliance with USDA policies in snacks and fundraising *Need more walkable/bike-able communities less reliant on cars 	<ul style="list-style-type: none"> *Childhood obesity affects our economically disadvantaged community more than others *Fresh fruits and vegetables, healthier foods cost a lot more *Low-income families have more difficult time accessing places where kids can move and exercise freely *Native Hawaiians and Pacific Islanders are disproportionately impacted; rates of poverty are higher for these groups * No word in Micronesian languages for "exercise" because it was part of their daily lives - now ability to live off their lands has been taken away; needs to be a way to translate and integrate their culture too 	<ul style="list-style-type: none"> * Start with access to healthier foods *Have more community gardens, especially in low-income areas * Free Department of Education sports activities moving down into lower grades vs. just high school *Having Med-QUEST billable services around exercise (e.g. pay for exercise classes) *Finding people where they are in communities, at place-based, existing social structures (like churches) instead of expecting them to come to clinics *Have a funded bicycle program

Voices from the Community

“Obesity and lack of exercise are pervasive and the root causes of most of the chronic health problems people have around here. More social outlets such as sports, exercise classes, education about nutrition and cooking would ameliorate this significantly and contribute to the community's cohesiveness and spiritual well-being.”

Summary

Voices from the Community

“Designing our communities to be connected by pedestrian pathways/linkages is imperative to increasing physical activity by our youth and others.”

Obesity is an increasing concern in Hawaii for residents of all ages. The problem is apparent for adults in secondary data, and children are also affected at an early age by poor nutrition and activity. Native Hawaiians and other Pacific Islanders are especially in need of assistance to improve their lifestyles, which is especially difficult given both cultural and socioeconomic barriers in these subpopulations. Key informants recommend improving access to physical activity options, increasing access to affordable and healthy food, and promoting school-based physical activity programs to target youth.

3.2.9 Family Planning

Core Indicators and Supplemental Information

Family Planning is notable in Hawaii due mainly to disparities:

- The lowest rate of intended pregnancies is among mothers aged less than 20 years (13.3%), followed by mothers aged 20-24 (36.4%); the rate of intended pregnancies in Hawaii (52.6%) has not met the HP2020 target (56.0%)
- A severe race disparity exists in the teen birth rate, with the highest rate among Native Hawaiian/Pacific Islander women (145.4 births/1,000 women aged 15-19 years)
- The proportion of infants born to mothers with less than 12 years of education is highest for Native Hawaiian/Pacific Islanders (13.7%)

Table 3.7: Core Indicators – Family Planning

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Pregnancies that are Intended (2009)	52.6 percent		✓	✗	✗
Teen Birth Rate (2011)	29.9 births/1,000 women aged 15-19 years		✓	✗	
Infants Born to Mothers with <12 Yrs Education (2011)	7.3 percent		✓	✗	

✓ indicates good comparison, ✗ indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

Furthermore, a recent statewide needs assessment of Maternal and Child Health Needs identified reducing the rate of unintended pregnancy (including a focus on teen pregnancy) as a priority for Women and Infants.⁷

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<p>*Priority is increasing access to long-acting, reversible contraception, such as IUDs and implants, which have high upfront costs</p> <p>*Cultural factors in different communities around family planning and birth are not well understood; more research is needed</p>	<p>*Higher incidence of unwanted/unintended pregnancies in low-income groups</p> <p>*Access to most effective contraceptive methods is limited or too expensive</p>	<p>*Community health centers are biggest assets for family planning</p> <p>*The centers' evening and weekend hours improve working patients' access to care</p>

Summary

Family planning is a need for particular groups in Hawaii, primarily low-income families. Access to long-acting, reversible contraception would help reduce the proportion of pregnancies that are unintended, but the cost of these family planning methods is prohibitive in some communities. The high teen birth

⁷ From the Family Health Services Division, Hawaii Department of Health Report: *State of Hawaii Maternal & Child Health Needs Assessment Summary*, November 2010. <http://hawaii.gov/health/doc/MCH-NASummary2010>

rate among particular race/ethnic groups is problematic for the social and educational development of mothers and healthy birth outcomes for newborns. Key informants note that community health centers are the biggest assets for providing family planning resources to those with low access.

3.2.10 Heart Disease & Stroke

Core Indicators and Supplemental Information

Strongly driven by poor lifestyle patterns, heart disease and stroke are a major concern for Hawaii. The core indicator summary score was highest for this topic area. Notable findings include:

- An increase in the prevalence of high blood pressure among adults, from 22.9% in 2003 to 30.2% in 2009; high blood pressure prevalence (30.2%) is in the worst half of U.S. states
- The prevalence of high cholesterol increased from 27.0% in 2003 to 38.9% in 2009; high cholesterol prevalence (38.9%) is in the worst quartile of U.S. states
- The death rate due to heart disease (72.3 deaths/100,000 population) was extremely high for Native Hawaiian/Pacific Islanders (282.2 deaths/100,000 population)
- The death rate due to stroke (35.8 deaths/100,000 population) was also very high for Native Hawaiian/Pacific Islanders (108.9 deaths/100,000 population)
- Hawaii has not met HP2020 targets for high blood pressure prevalence (Hawaii: 30.2%; target: 26.9%), high cholesterol prevalence (Hawaii: 38.9%; target: 13.5%), and stroke death rate (Hawaii: 35.8 deaths/100,000 population; target: 33.8 deaths/100,000 population)

Table 3.8: Core Indicators – Heart Disease & Stroke

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
High Blood Pressure Prevalence (2009)	30.2 percent	X	X	X	X
High Cholesterol Prevalence (2009)	38.9 percent	X	X	✓	X
Heart Disease Death Rate (2009-2011)	72.3 deaths/100,000 population		✓	X	✓
Stroke Death Rate (2009-2011)	35.8 deaths/100,000 population		✓	X	X

✓ indicates good comparison, X indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

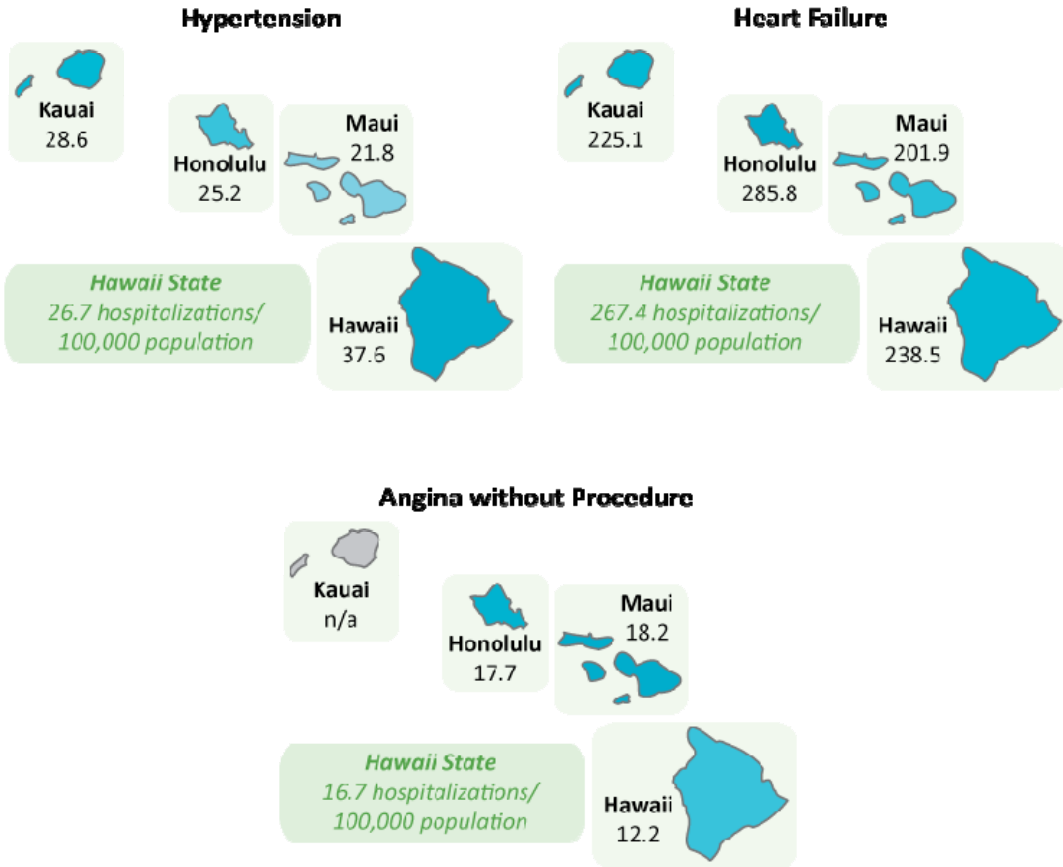

Hospitalization Rates

Among Hawaii counties in 2011, Hawaii County had the highest rate of hospitalization due to hypertension, Honolulu County had the highest hospitalization rate due to heart failure, and Maui County had the highest rate due to angina without procedure.

Figure 3.16: Hospitalization Rates due to Heart Disease, 2011

*Suppressed due to low case count

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
----------------	---	-------------------------

<ul style="list-style-type: none"> *Need for education on smoking prevention/cessation, blood pressure control, weight control, aspirin *Need to look toward primary prevention and wellness, developing awareness and healthy habits *Kids are getting driven to structured activities instead of playing outside *Parents don't have time to cook at home and end up eating less healthy but faster food *Food is an important component of many cultural events, but many times the food being served is unhealthy *Lack of resources for quick EMS response, heart/stroke patient rehabilitation 	<ul style="list-style-type: none"> *Disproportionate impact on Native Hawaiians and Filipinos *Language barriers for Filipino immigrant population *Storytelling is an important way of communicating among the Pacific Island populations, and health information should be shared with this in mind *Access to technology and computer illiteracy may be barriers to utilizing online tools 	<ul style="list-style-type: none"> *A lot of resources are available, it's a matter of leveraging and collaborating *Ability to collaborate when everyone brings their strengths, resources, expertise, and knowledge to the table
--	---	--

Summary

The lack of healthy eating and exercise behaviors in Hawaii largely contribute to poor cardiovascular health. Those living in low-income areas are disproportionately affected, and resources are not effectively reaching those most in need. While the high hospitalization rate due to heart failure in Honolulu County may reflect the higher density of persons living on Oahu for the availability of special needs care, hypertension hospitalizations in Hawaii County suggests that this population has particularly poor heart health. Key informants cite a lack of resources for quick EMS response and heart/stroke patient rehabilitation, and encourage interventions that leverage existing resources and collaboration.

3.2.11 Immunizations & Infectious Diseases

Core Indicators and Supplemental Information

Despite the limited national comparisons and disparity measurements that were possible for core indicators, there are several concerns in this area:

- The pneumonia vaccination rate for adults 65 and older (66.8%) is in the worst half of U.S. states and has not met the HP2020 target of 90%; influenza vaccination rate for adults 65 and older (73.2%) has not met the HP2020 target of 90%
- Syphilis incidence increased from 1.6 cases per 100,000 population in 2005-2009 to 1.8 in 2007-2011
- Hawaii has not met two tuberculosis HP2020 targets: tuberculosis incidence rate (Hawaii value: 9 cases/100,000 population; target: 1 case/100,000 population) and TB among foreign-born persons (Hawaii value: 37.4 cases/100,000 population; target: 14 cases/100,000 population)

Table 3.9: Core Indicators – Immunizations & Infectious Diseases

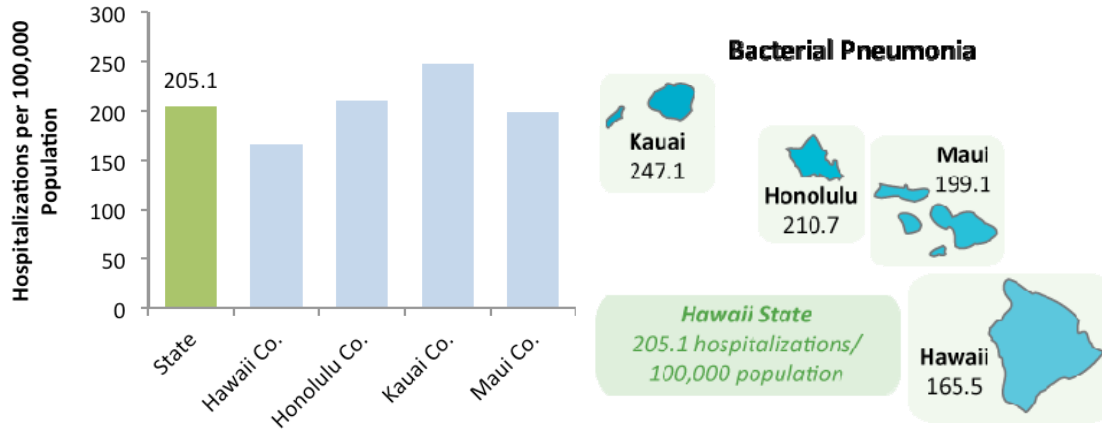

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Influenza Vaccination Rate 65+ (2010)	73.2 percent	✓	✓	✓	✗
Pneumonia Vaccination Rate 65+ (2010)	66.8 percent	✗	✓	✓	✗
Acute Hepatitis B Incidence Rate (2007-2011)	0.7 cases/100,000 population		✓		
AIDS Incidence Rate (2011)	4.6 cases/100,000 population		✓		
Chlamydia Incidence Rate (2011)	436.6 cases/100,000 population		✓		
Gonorrhea Incidence Rate (2011)	49.8 cases/100,000 population		✓		
Syphilis Incidence Rate (2007-2011)	1.8 cases/100,000 population		✗		
Tuberculosis Incidence Rate (2011)	9 cases/100,000 population		✓		✗
TB Among Foreign-Born Persons (2011)	37.4 cases/100,000 population				✗

✓ indicates good comparison, ✗ indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

Hospitalization Rates

Hospitalizations due to bacterial pneumonia were the third most frequent cause of hospitalization (n=2252) in 2011 among the 15 preventable causes studied. The highest rate of hospitalization due to bacterial pneumonia in 2011 was in Kauai County, followed by Honolulu County.

Figure 3.17: Hospitalization Rates due to Bacterial Pneumonia, 2011

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<ul style="list-style-type: none"> *Food borne diseases such as noroviruses are highly communicable *Lack of tracking and surveillance for non-flu respiratory pathogens 	<ul style="list-style-type: none"> *Lack of access in underserved rural areas to regular vaccination schedules; rural populations increasingly turning to naturopathic medicine that discourages vaccination 	<ul style="list-style-type: none"> *School-located vaccination programs have created some strong and nontraditional partnerships *Partnerships with schools, schools of nursing, health insurers, general community, and healthcare

*Over-use of antibiotics increasing resistant bacteria	*Pockets of Southeast Asian/Pacific Islander immigrant communities with low/no vaccination access in home country or U.S.	providers helps in terms of overall communication
*Zoonotic diseases		
*Highest TB rates in U.S.	*Micronesians Compact of Free Association (COFA) agreement allows Micronesians to enter U.S. without passport and health records	
*Low usage of immunization registry means that we don't have accurate, real-time data on immunization rates and geographic regions where efforts should be concentrated	*With immigrants and IV drug users, we see higher rates of Hepatitis C and Hepatitis B (latter is vaccine preventable)	
*Growing population of people refusing vaccinations		

Summary

Hawaii faces unique problems in infectious disease control due to the regular influx of new residents from far and neighboring countries. The frequent hospitalizations due to bacterial pneumonia could, in many cases, be prevented by increasing vaccination rates among adults ages 65 and older from the 66.8% coverage rate to the HP2020 target of 90% coverage. Maintaining vaccination levels is essential to preventing widespread illness, but tracking vaccination coverage is difficult due to low use of the state's immunization registry. Geographic and economic barriers contribute to residents' challenges in complying with recommended vaccination schedules. It was noted that some residents may be likely to forgo childhood vaccinations for personal reasons including the practice of non-traditional medicine that discourages vaccines. For those diseases without a vaccine, efforts to prevent disease must overcome barriers that are similar to those faced in chronic disease prevention: effective communication that is culturally appropriate. Key informants recommend partnerships with schools, health providers, and community organizations to increase vaccine availability and provide effective communication for disease prevention.

3.2.12 Injury Prevention & Safety

Core Indicators and Supplemental Information

Core indicators demonstrate large disparities in the burden of injury related deaths:

- The motor vehicle collision death rate is much higher for Native Hawaiian/Pacific Islanders (25.8 deaths/100,000 population) than the general population (7.8 deaths/100,000 population)
- The drowning death rate is much higher for men (4.4 deaths/100,000 males) than women (0.9 deaths/100,000 females)
- The poisoning death rate is highest for Native Hawaiian/Pacific Islanders (35.6 deaths/100,000 population), followed by American Indian/Alaska Natives (29.9) and Caucasians (22.3)
- Native Hawaiian/Pacific Islanders have the highest death rates for injuries (150.0 deaths/100,000 population) and unintentional injuries (91.7)
- Healthy People targets are unmet for drowning deaths (Hawaii: 2.6 deaths/100,000 population; target: 1.1 deaths/100,000 population) and pedestrian deaths (Hawaii: 1.7 deaths/100,000 population; target: 1.3 deaths/100,000 population)

Table 3.10: Core Indicators – Injury Prevention & Safety

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Hospitalization Rate due to Motor Vehicle Collisions (2009)	63.6 hospitalizations/100,000 population		↗		
Motor Vehicle Collision Death Rate (2009-2011)	7.8 deaths/100,000 population		↗	X	↗
Pedestrian Death Rate (2007-2010)	1.7 deaths/100,000 population		↗		X
Drowning Death Rate (2009-2011)	2.6 deaths/100,000 population		↗	X	X
Poisoning Death Rate (2009-2011)	12.9 deaths/100,000 population		X	X	↗
Hospitalization Rate due to Unintentional Injuries (2009)	323 hospitalizations/100,000 population		↗		
Unintentional Injury Death Rate (2009-2011)	29.8 deaths/100,000 population		↗	X	↗
Hospitalization Rate due to Injuries (2009)	421.7 hospitalizations/100,000 population		↗		↗
Injury Death Rate (2009-2011)	48.4 deaths/100,000 population		↗	X	
Hospitalization Rate due to Assault (2009)	24 hospitalizations/100,000 population		↗		

↗ indicates good comparison, X indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<ul style="list-style-type: none"> *Falls are a leading cause of hospitalization among elderly *Suicides are now the leading cause of injury deaths unless all motor vehicle incidents are lumped together *Motor vehicle incidents are also concerning: passenger, pedestrian, bicycle, motorcycle *Increase in poisoning deaths often related to prescription drugs *Other areas of need are drowning prevention, violence and abuse prevention 	<ul style="list-style-type: none"> *Health disparities might not seem as obvious as with chronic disease, but they do exist *Injuries are a leading cause of death/disability for ages 1-44, so this indicates a possible disproportionate effect on uninsured *People with less education may be less likely to engage in protective risk reduction factors *Some cultures accept risky behaviors (e.g. drinking and driving is seen as ok) 	<ul style="list-style-type: none"> *Child and passenger safety programs at community health centers *New database by Department of Public Safety allows providers to look up a patient's history to see if they're drug seeking or potentially abusing *SBIRT (Screening, Brief Intervention, Referral and Treatment) program underway to change behavior and reduce injury

Summary

A large number of accidental deaths and hospitalizations could be prevented by reducing risky behaviors in Hawaii. Some residents are more likely to put themselves at increased risk of injury by engaging in risky behaviors or avoiding safety precautions. Communicating the importance of behavior changes to the most at-risk populations is essential, but other interventions may involve policy changes and

increased enforcement of existing policies to reduce traffic injuries. Further efforts may include improving mental health care to prevent suicides and prescription drug abuse.

3.2.13 Maternal, Fetal & Infant Health

Core Indicators and Supplemental Information

The following concerns were identified for Hawaii in this area's core indicators:

- Preterm births were most common for mothers aged 45-54 (41.7%), as were babies with low birth weight (39.6%); the HP2020 target for low birth weight is unmet (Hawaii: 8.2%; target: 7.8%)
- The proportion of births delivered by cesarean section increased from 22.5% in 2003 to 27.7% in 2010; C-section births were most common among mothers aged 45-54 (70.8%) and mothers aged 35-44 (36.1%)
- Four HP2020 targets regarding infant feeding are unmet: newborns who received formula within the first two days of life (Hawaii: 23.9%; target: 14.2%), infants who were breastfed at 6 months (Hawaii: 52.4%; target: 60.6%), infants who were breastfed exclusively through 3 months (Hawaii: 42.4%; target: 46.2%), and infants who were breastfed exclusively through 6 months (Hawaii: 20.8%; target: 25.5%)

Table 3.11: Core Indicators – Maternal, Fetal & Infant Health

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Newborns who Received Formula within the First 2 Days of Life (2011)	23.9 percent				X
Infants who were Ever Breastfed (2011)	85 percent				✓
Mothers who Breastfeed (2009)	93.3 percent		✓	✓	
Children Still Breastfeeding at 4 Weeks (2008)	81.9 percent		✓		
Children Still Breastfeeding at 8 Weeks (2008)	72.5 percent		✓		
Infants who were Breastfed at 6 Months (2011)	52.4 percent				X
Infants who were Breastfed Exclusively Through 3 Months (2011)	42.4 percent				X
Infants who were Breastfed Exclusively Through 6 Months (2011)	20.8 percent				X
Mothers who Received Late or No Prenatal Care (2011)	15.2 percent		✓	✓	
Mothers who Smoked During Pregnancy (2009)	9.6 percent		✓	✓	
Women who Binge Drink Prior to Pregnancy (2009+) (2009)	23.1 percent			✓	
Preterm Births (2011)	9.9 percent		✓	X	✓
Babies with Low Birth Weight (2011)	8.2 percent		✓	X	X
Infant Mortality Rate (2010)	5.8 deaths/1,000 live births		✓		✓
Births Delivered by Cesarean Section (2011)	26.5 percent		X	X	
Births Occurring in Baby-Friendly Facilities (2011)	8.7 percent				✓

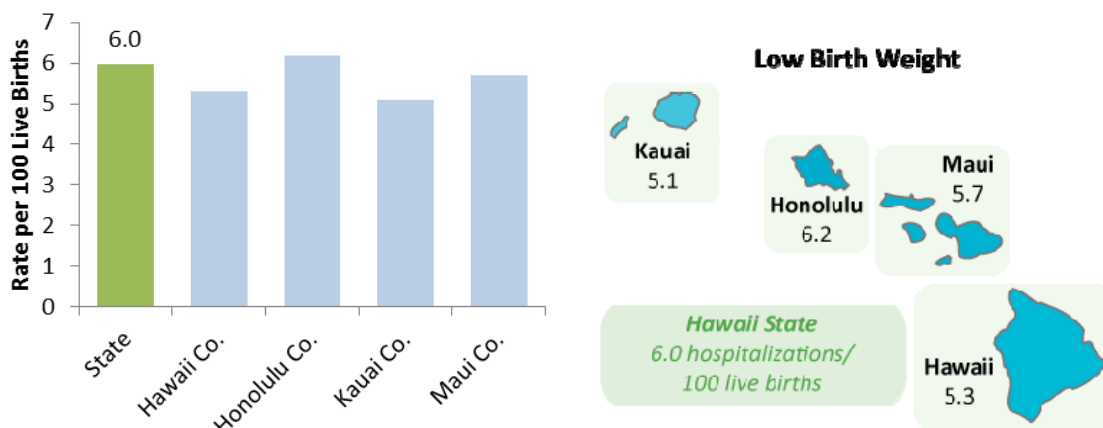

✓ indicates good comparison, X indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

Furthermore, a recent statewide needs assessment of Maternal and Child Health Needs identified reducing the use of alcohol during pregnancy as one of its priorities for Women and Infants.⁸

Hospitalization Rates

According to hospitalization data, Honolulu County had the highest rate of low birth weight among its newborns in 2011, followed by Maui County.

Figure 3.18: Low Birth Weight Rate per 100 Live Births, 2011

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<ul style="list-style-type: none"> *Root causes of poor health (e.g. social determinants, stress management skills) are not being addressed and lead to poor lifestyle choices *High rate of women binge drinking during pregnancy; haven't gotten message out successfully 	<ul style="list-style-type: none"> *Underserved have higher probability of experiencing high stress and making poor health choices *Tendency for poor to be less educated and be less likely to have insurance 	<ul style="list-style-type: none"> *Would like to see programs that help new mothers learn skills around coping with stress *Should trend toward quality improvement and performance measure like reducing readmission

Summary

While data demonstrates that many poor birth outcomes are for older mothers, the stress experienced by low-income mothers is a dangerous factor for fetal and infant health. Key informants recommend removing the barriers that deter low-income women from accessing care and providing programs to holistically improve the quality of life for women and children. Additionally, the increasing trend in cesarean births may reflect that infants and mothers are at an unnecessarily increased risk of complications in cases where surgery is not necessary.

Voices from the Community

"We need more midwifery care options on Oahu that are affordable."

⁸ From the Family Health Services Division, Hawaii Department of Health Report: *State of Hawaii Maternal & Child Health Needs Assessment Summary*, November 2010. <http://hawaii.gov/health/doc/MCH-NASummary2010>

3.2.14 Mental Health & Mental Disorders

Core Indicators and Supplemental Information

Two mental health indicators exhibit race disparities and one HP2020 target is unmet:

- The proportion of adults with a depressive disorder was highest for Other Asians (16.6%), followed by Caucasians (15.1%)
- The suicide death rate is highest for Native Hawaiian/Pacific Islanders (39.3 deaths/100,000 population), followed by Caucasians (17.5 deaths/100,000 population). Hawaii has not met the HP2020 target for the suicide death rate (10.2 deaths/100,000 population)

Table 3.12: Core Indicators – Mental Health & Mental Disorders

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Self-Reported Good Physical and Mental Health (2010)	56.4 percent		↘	↘	
Mental Health Treatment for Children (2009/2010)	83.7 percent				↘
Suicide Death Rate (2009-2011)	13.1 deaths/100,000 population		↘	X	X
Adults with a Depressive Disorder (2010)	8.9 percent		↘	X	

↘ Indicates good comparison, X Indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

Figure 3.19: Federally-Designated Mental Health Professional Shortage Areas

There may be an insufficient number of mental health indicators to fully assess the scope of the issue. The Health Resources and Services Administration has designated at least part of each Hawaii county as a mental health professional shortage area.

Hospitalization Rates

It is notable that mental health was the most frequent cause for hospitalization among the 15 different preventable hospitalizations that were studied – 5,180 hospitalizations were due to mental health in Hawaii in 2011. While 92.1% of all mental health admissions were from those 18-64 years old, this age group only represents 63.0% of the total population. Also, more than half of the mental health admissions were for males (59.6%). The proportion of mental health hospitalizations by race is compared to the population make-up by race according to data provided by HHIC in Figure 3.20. A disproportionately low number of mental health hospitalizations are attributed to Hawaiians, Filipinos,

and Japanese. The proportion of hospitalization among Whites and all other races are is higher than would be expected given the population make-up.

Because mental health hospitalization rates are not risk or age adjusted, the mental health admission rates are not compared across geographies due to uncertainties in varying population characteristics. All 2011 values are included in Appendix B. Further data on mental health hospitalizations at a sub-county level can be found in the State of Hawaii Primary Care Needs Assessment Data Book 2012.⁹

Figure 3.20 Mental Health Hospitalizations by Race, Hawaii, 2011

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<ul style="list-style-type: none"> *Highest needs in capacity are around acute psychiatric care, for hospitals in rural areas and also on Oahu *Lack of psychiatrists available to community *Need to integrate physical and mental health areas; increase comfort level of our healthcare system with addressing behavioral health needs *Mental health issues in parents may prevent students from coming to school because parents can't care for students or the family *Takes more than a physician to provide adequate care for this 	<ul style="list-style-type: none"> *Cutbacks in mental health disproportionately impacting low-income families *Physicians' concern is adequate reimbursement and we have to figure this out for Medicaid/Medicare populations *Need among veterans is not met by Veterans Administration if they were not honorably discharged or did not complete their years and are therefore not qualified for services *Mental health stigma across cultures and ethnicities--a lot of shame attached with behavioral health. *Native Hawaiians have a lot of 	<ul style="list-style-type: none"> *One opportunity is continuing to build capacity around statewide tele-access *DOH pilot in Kalihi Palama area integrates primary care and behavioral health with community mental health center *YO (Youth Outreach) program at Waikiki Health Center, for teens with mental health issues that are runaway and homeless - they go out and find and reach kids on the streets, since a lot of them won't go into clinics

population; we need to wrap around and look at navigators or care organization

complications due to access issues, social determinants of health

*Micronesian new arrivals don't know how to access system

Summary

Mental health is a clear area of need in Hawaii and access to quality mental health care remains an issue. Residents with the most difficulty accessing mental health care include low-income families, rural residents, veterans, Native Hawaiians, and Compact of Free Association (COFA) migrants. For many, insurance coverage for mental health care is likely an issue. Reducing hospitalizations for mental health disorders is important for improved quality of life and reduced health services costs for mental health. Key informants say that improving mental health will require integrating mental health services with primary care, which entails cooperation between physicians, mental health providers, social care workers and healthcare navigators.

3.2.15 Older Adults & Aging

Core Indicators and Supplemental Information

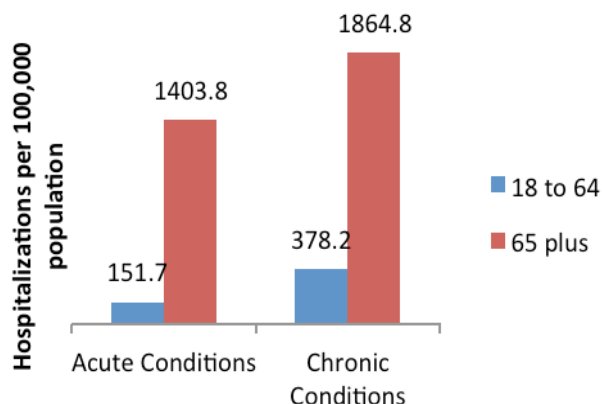

Little data specific to older adults was available for the core indicator summary. The rate of hospitalization due to falls among people aged 65 and older increased from 880 cases/100,000 population in 2003 to 920.2 in 2009. As seen under Immunizations & Infectious Diseases (section 3.2.11), vaccination rates among people 65 and older have not met Healthy People targets.

Hospitalization Rates

Overall, most hospitalizations occur among older adults. With the exception of hospitalizations due to short-term complications of diabetes and mental health hospitalizations, the unadjusted hospitalization rate was much higher for adults aged 65 and older.

--	---	--

Voices from the Community

"Much more emphasis needs to be placed on serving the elderly's access to housing, nutrition, health and transportation."

Summary

Although health data for seniors is lacking, the longevity in Hawaii is leading to an increased need for care for seniors. Specific needs of older residents of Hawaii include increased availability of in-home care, careful education on specific medications and their uses and impacts, and access to palliative care in addition to medical treatment. The high cost of special needs care is especially prohibitive for low-income seniors' health and wellness. Furthermore, coordination of care for seniors could reduce the burden of managing advice and medications from multiple providers and more effectively deliver health services for this growing population.

3.2.16 Oral Health

Core Indicators and Supplemental Information

Core indicators for oral health in Hawaii reflect favorable comparisons to the nation, meeting HP2020 targets for adults who visited a dentist (Hawaii: 70.1%; target: 49%), adults 45-64 with one or more tooth extractions (Hawaii: 44.4%; target: 68.8%), and adults 65 and older with total tooth loss (Hawaii: 7.4%; target: 21.6%). The largest disparity evident in the data was for adults aged 65 and older with total tooth loss in 2010, which was much higher among Native Hawaiian (12.7%) and Filipino adults (11.5%) than among the general population (7.4%).

Although no oral health indicators in the summary addressed children, a report by the Pew Research Center gave the State of Hawaii a grade of "F" for meeting only one out of

Figure 3.22: Federally-Designated Dental Health Professional Shortage Areas

eight benchmarks for key policy indicators. In *The State of Children's Dental Health: Making Coverage Matter*,¹⁰ Hawaii compared poorly to the nation due to several factors, including:

- Sealant programs were in place in 0% of high-risk schools in 2010
- Optimally fluoridated water was provided to only 10.8% of citizens on community systems in 2008
- As of 2010, the Medicaid program does not reimburse medical care providers for preventive dental health services

The designation of dental health professional shortage areas provides further evidence of need in this area. The Island of Maui as well as populations within the Kalihi Valley and Kalihi-Palama areas of Honolulu County have been designated by the Health Resources and Services Administration as having a shortage of dental health professionals.

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
*We have particularly bad dental health in Hawaii *Access to dental care is a huge issue	*Medicaid-covered services are not adequate; kids have great benefits but no access, adults have access but no benefits	*Need to support appropriate presence of community health centers, particularly important for dental and behavioral health

Summary

Given the large impact that oral health has on overall health and wellbeing, it is important that Hawaii residents have access to and utilize preventative dental care. Both insurance coverage and access to dental care are necessary to maintain good oral health. Several statewide policy changes are potential avenues for improving oral health, including strengthening Medicaid coverage for dental care, providing dental sealants through schools, and fluoridating public water. Key informants also recommend supporting dental care programs provided by community health centers.

3.2.17 Respiratory Diseases

Core Indicators and Supplemental Information

Although only two asthma indicators were available for this topic, adult asthma had several poor comparisons in Hawaii:

- The proportion of adults who have been told by a healthcare provider that they currently have asthma (9.4%) is in the worst half of U.S. states
- Asthma prevalence among adults increased from 5.6% in 2003 to 9.4% in 2010
- By race/ethnicity, the percent of adults with asthma is highest for adults of Other race (22.8%), Native Hawaiian adults (14.9%) and Chinese adults (11.3%)
- Although the disparity was not as great in children, the asthma prevalence among Native Hawaiian children (18.8%) was also much higher than the general population (11.1%)

¹⁰ From the Pew Research Center's *The State of Children's Dental Health: Making Coverage Matter*, May 2011. http://www.pewstates.org/uploadedFiles/PCS_Assets/2011/The_State_of_Childrens_Dental_health.pdf

Table 3.13: Core Indicators – Respiratory Diseases

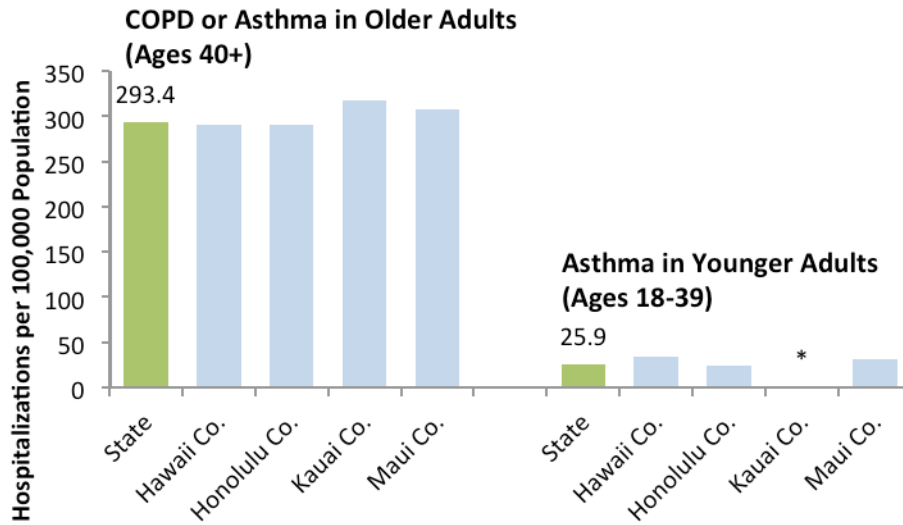

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Adults with Asthma (2010)	9.4 percent	X	X	X	
Children with Current Asthma (2010)	11.1 percent		✓	✓	

✓ Indicates good comparison, X Indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

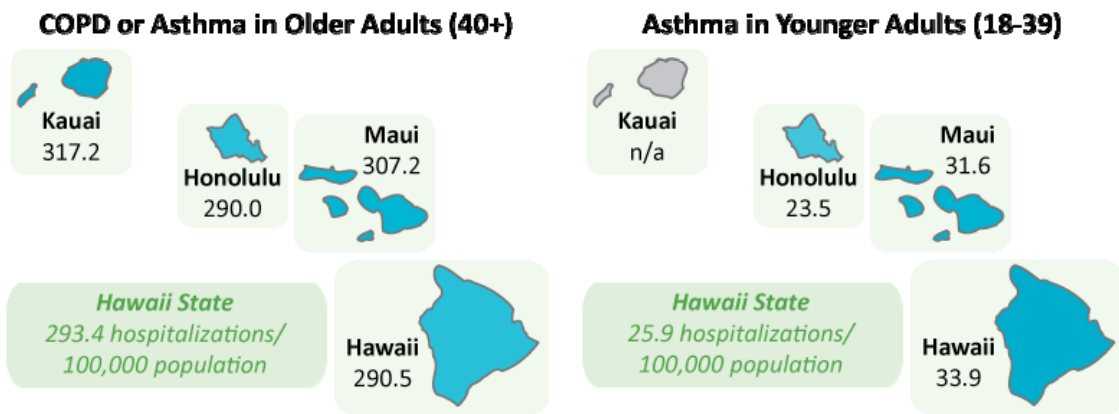

Hospitalization Rates

In 2011, the hospitalization rate due to COPD or asthma in older adults (40+) was highest in Kauai County, and the hospitalization rate due to asthma in younger adults (18-39) was highest in Hawaii County.

Figure 3.23: Hospitalization Rates due to Respiratory Disease, 2011

*Suppressed due to low case count

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<p>*Tobacco-related respiratory illness is preventable</p> <p>*Women who are pregnant and smoking are a concern; women who resume smoking after pregnancy also put children’s respiratory health at risk</p> <p>*Asthma correlated with obesity for unknown reasons</p> <p>*Asthma prevalence is significant in kids ages 0-4</p> <p>*Asthma most common reason for child to be hospitalized</p> <p>*Asthma causes school absenteeism and drop in grades</p>	<p>*Lower socioeconomic levels correlated with higher smoking rates</p> <p>*Native Hawaiian, Pacific Islander, and Filipino populations also have higher smoking rates</p> <p>*Asthma more prevalent with poverty; higher rates where housing conditions are not good</p> <p>*Native Hawaiians have highest rate of asthma & chronic disease</p>	<p>*Hawaii’s progressive laws have positively impacted smoking rates in last 10 years</p> <p>*”Catch a roach” program in public housing helps reduce this asthma trigger</p> <p>*Chronic disease self-management programs</p> <p>*Data collection and analysis efforts play an important role in educating and empowering people</p> <p>*Community health centers are a great model</p>

Summary

Respiratory disease is a health issue with high disparity in Hawaii. Residents living in poverty are more likely to smoke and more likely to live in conditions that may trigger asthma. Sub-populations that are often living below poverty are most impacted by respiratory disease, including Native Hawaiian, Pacific Islander, and Filipino families. Controlling asthma is particularly important for children, whose education can be negatively affected by the disease if the school environment is not able to provide asthma medication support. Key informants herald progressive laws that have made an impact on smoking rates, and recommend chronic disease self-management programs and further data collection and analysis efforts.

Voices from the Community

“[One health issue is] respiratory problems from cane burning.”

3.2.18 Social Environment

Core Indicators and Supplemental Information

Although possible comparisons were limited in the core indicator summary for this area, two social environment indicators displayed poor trends:

- The percentage of teens (high school students) who play three or more hours of video or computer games on an average school day increased from 31.1% in 2007 to 36.6% in 2011

- The percentage of young teens (middle school students) who play three or more hours of video or computer games on an average school day increased from 25.2% in 2007 to 37.5% in 2011

Table 3.14: Core Indicators – Social Environment

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Single-Parent Households (2006-2010)	29 percent	✓			
Teens with More Than 3 Hours of Computer/Video Game Time (2011)	36.6 percent		✗		
Young Teens with More Than 3 Hours of Computer/Video Game Time (2011)	37.5 percent		✗		
Teens who Watch 3+ Hours of Television (2011)	24.7 percent		✓		
Young Teens with More Than 3 Hours of TV Time (2011)	39.4 percent		✓		

✓ Indicates good comparison, ✗ Indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

A higher percent of Hawaii households were linguistically isolated as well: 6.2% of households reported that all of its members ages 14 and over had some difficulty speaking English, contrasted with 4.8% of households in the U.S.¹¹ Of note, certain race/ethnicity groups are also more affected by poverty, as seen in Figure 3.6.

An additional consideration for the social environment is the inclusion of two priorities in a recent statewide needs assessment of Maternal and Child Health Needs¹²:

- Reduce the rate of child abuse and neglect with special attention on ages 0-5 years
- Prevent bullying behavior among children with special attention on adolescents age 11-18

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
*Haven't paid enough attention to the social factors that impact health and how school success, housing, poverty, health are all interrelated	*Underserved are less likely to have safe streets, places to exercise, access to good food, fruits, and vegetables	*We have to sustain collaboration beyond grant funds; harder to do without funding but maybe in long run it is better, not so dependent on money that will disappear
*Need to understand how social factors are causative factors for health conditions	*Stress factor is incredibly high in terms of basic living, having enough resources to just make it; stress factors lead to abusive situations, poor health	*Affordable Care Act is a good start but we need societal changes to make a dent in health care
*Looking at caring for ill, for diseased is not the answer; it is really the deeper issue of social issues we have to work on, which will take a huge effort and there is	*Compliance issues caused by lack of access to transportation	
	*Societal priorities, things we value	

¹¹ U.S. Census, American Community Survey, 2006-2010 Estimates

¹² From the Family Health Services Division, Hawaii Department of Health Report: *State of Hawaii Maternal & Child Health Needs Assessment Summary*, November 2010. <http://hawaii.gov/health/doc/MCH-NASummary2010>

no money or reimbursement for it
 *Most chronic disease areas can be traced back to lifestyle, education, and nutrition

may not lend themselves to a healthy lifestyle
 *Native Hawaiians more likely to live in poverty and have social environment issues to confront

Summary

Largely driven by economic insecurity, social issues such as unemployment, education, alcoholism, and domestic violence all influence a community's health. Low-income residents are most impacted by poor social environments that limit opportunities for economic and social advancement and cause stress-induced health problems. Furthermore, the increasing amount of time spent inactive among teens increases obesity and hinders the social development of Hawaii's communities. Key informants advise against temporary sources of funding in this area and feel that societal change is essential to improving health.

Voices from the Community

"Domestic violence/ interpersonal violence (for teens and adults) and bullying are health and community issues that need to be addressed. We do not talk about [violence] or bullying enough and it affects the health of the people involved in these situations - mentally and physically."

3.2.19 Substance Abuse & Lifestyle

Core Indicators and Supplemental Information

Substance abuse is a relatively high ranking topic in the core indicator summary:

- The percent of adults who binge drink (17.9%) is within the worst quartile of U.S. states; the age groups most likely to binge drink are adults aged 25-34 (29.9%), aged 18-24 (23.0%), and aged 35-44 (20.9%)
- Although the percent of adults who smoke (14.5%) is within the better half of U.S. state values, the HP2020 target (12.0%) is unmet in Hawaii; smoking is most common among Native Hawaiian adults (26.8%)
- The proportion of teens (grades 9-12) who use marijuana increased from 17.2% in 2005 to 21.9% in 2011; Hawaii is in the worst half of U.S. states and the HP2020 target for this indicator (6.0%) is unmet
- The proportion of young teens (grades 6-8) who use marijuana increased from 3.9% in 2005 to 9.3% in 2011; the HP2020 target for this indicator (6.0%) is unmet

Beyond the indicators included in the table below, there were 24 tobacco policy indicators included in the summary which were compared to HP2020 targets only. Of these, 10 targets are not met in Hawaii. These indicators and their targets can be found in Appendix A.

Table 3.15: Core Indicators – Substance Abuse & Lifestyle

Indicator	Hawaii Value	National Comparison	Trend	Disparity	HP2020 Target
Adults who Binge Drink (2010)	17.9 percent	X	✓	X	✓
Teens who Use Alcohol (2011)	29.1 percent	✓	✓		
Liquor Store Density (2010)	3.7 stores/100,000 population	✓	✓		
Adults who Smoke (2010)	14.5 percent	✓	✓	X	X
Teens who Smoke (2011)	8.7 percent		✓		✓
Illegal Tobacco Sales to Minors (2011)	5.9 percent				X
Teens who Use Marijuana (2011)	21.9 percent	X	X		X
Young Teens who Use Marijuana (2011)	9.3 percent		X		X
Teens who have Used Methamphetamines (2011)	3.4 percent	✓	✓		

✓ indicates good comparison, X indicates poor comparison, blank cell indicates no comparison possible. Please see Methods section for cutoffs. All values and data sources included in Appendix A.

In 2006-2010, 8.9 percent of hospital admissions in Hawaii were associated with a substance related disorder. The percent of admissions associated with a substance related disorder was higher in Maui County (11.9%) and Hawaii County (11.4%) than Kauai County (8.1%) and Honolulu County (8.0%)¹³.

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
<ul style="list-style-type: none"> *Significant need in drug and alcohol addiction and related problems like accidents and psycho-social disorders *Highest drug use for youth is marijuana followed by alcohol *Ice/Crystal Meth is big problem for both youth and adults *Low health literacy leads to poor decisions when seeking care *Need to address mental health & substance abuse co-morbidity 	<ul style="list-style-type: none"> *With Marshallese population and others, there are issues related to language and culture; need for translation *With Hawaiians, cultural issues come into play and comes down to how we offer services and what services we offer 	<ul style="list-style-type: none"> *Work with University of Hawaii Center on the Family *Hawaii Primary Care Association is required to do a lot of things around language and services and will have a good handle on this

Summary

Hawaii's substance abuse problems have a wide impact on health. Alcohol abuse is particularly severe among young adults and teens, and the danger of alcohol use during pregnancy has yet to be effectively communicated. Smoking is much more common among race groups who also tend to be more impacted by other economic and social problems. Furthermore, marijuana use among teens is increasing. Hospitalization patterns suggest that substance abuse is more of a problem in Maui County and Hawaii

¹³ From the Family Health Services Division, Hawaii Department of Health Report: *State of Hawaii Primary Care Needs Assessment Data Book 2012*, July 2012. <http://hawaii.gov/health/doc/pcna2012datobook.pdf>

County as a larger proportion of hospitalizations in these counties are substance abuse related. Intervention for substance abuse for certain sub-populations is inhibited by translation needs and a lack of culturally appropriate communication. Intervening on psychosocial disorders and other mental health issues may indirectly assist in controlling substance abuse, and there are at least 14 tobacco policy changes that could be implemented to meet HP2020 targets and influence behavior.

3.2.20 Transportation

Core Indicators and Supplemental Information

Access to transportation is essential for accessing health services, and the choices a community makes for daily transportation can have a great impact on the environment. Although the average time spent commuting to work in Hawaii (25.9 minutes) is within the worst quartile of U.S. states, more workers in Hawaii use public transportation (6.0%) or walk to work (4.7%) than in most U.S. states.

Key Informant Interviews

Needs/Concerns	Impact on Low-Income, Underserved/Uninsured, Race/Ethnic Groups	Opportunities/Strengths
*Transportation is a major issue on all Hawaiian islands; rail and bus won't help seniors *Lack of transportation contributes to lack of access to care	*Handicabs (door to door service for wheelchairs, walkers, and stretchers) are often too expensive	*Existing geriatric home visit program

Summary

While commuters in Hawaii are utilizing alternative transportation options that are healthy for the environment, transportation issues exist for older adults. Adults who have special needs for transportation may have trouble affording services, especially if they need to travel long distances for care. Efforts to improve this barrier for older adults may include funding home visit programs, expanding telemedicine, or providing transportation that is both affordable and accessible.

4 Community Health Needs Summary

4.1 Findings/Conclusions

The community health needs of Hawaii span across all of the topics included in this report. Some health issues impact a larger proportion of the population, while others are of greatest impact to particular groups or sub-geographies. In order to assess the health needs in Hawaii, both objective indicator data and subjective interviews were considered. While indicator data provided a good starting point for determining where attention should be focused, sometimes the data was lacking in depth or breadth on important topics. Interviewing key informants who have local knowledge on the topics helped to fill in details and bring attention to data gaps. Surveying residents elicited health concerns from a small proportion of the community and added highlights. Planners will want to consider how to impact these areas, as many areas can be addressed concurrently with appropriate primary and holistic interventions.

Several common themes emerge in this assessment that can guide community health improvement planning:

All groups experience adverse health outcomes due to chronic disease and health risk behaviors

While there are significant disparities in chronic disease, it is important to note that areas such as heart disease and stroke, cancer, diabetes, and asthma affect many residents of Hawaii. Moreover, key health behaviors that impact chronic disease, including optimal exercise, nutrition, and weight need attention across all age, gender, and race/ethnic groups. While some core indicators in the area of physical activity and body weight compared favorably to the nation, it is important to remember that obesity and inactivity is a problem nationwide. Although Hawaii's obesity rate is lower than the nation, it is still at a hazardous level that signals the need to improve healthy behaviors. Attention to this area at many levels could have an enormous positive impact on the long-term health of the community.

As a chronic condition that significantly influences overall health, mental health and associated substance abuse arose repeatedly throughout key informant interviews as a concern in Hawaii. Suicide was noted to be a leading cause of injury deaths in Hawaii, and the increasing rate of poisoning deaths was attributed to prescription drugs. In addition, many injury-related hospitalizations and deaths may be attributable to substance abuse, including motor vehicle collision deaths caused by driving under the influence of alcohol. Specific populations in need include: teens, whose increasing drug use interferes with educational progress; pregnant women who use alcohol during pregnancy; new mothers who need to learn stress-coping skills; and older adults with dementia or depression associated with disability and/or the loss of loved ones. Addressing mental and behavioral health can reduce the rate of overutilization of emergency rooms, and some key informants feel that providing adequate mental health care will require integration with primary care services.

Greater socioeconomic need and health impacts are found among certain groups and places in Hawaii

Largely driven by a lack of access to health services, the socioeconomically disadvantaged populations in Hawaii are repeatedly mentioned throughout this report as experiencing greater effects of poor health. Low-income residents are more likely to be missed in cancer screening, unable to afford effective contraceptives, and lacking assistance from health professionals in assessing and maintaining physical and mental health. While Hawaii has relatively good health insurance coverage, some essential health needs remain inaccessible to many, including full spectrum mental health services and quality long-term care for older adults. Hawaii residents with a disability are also more likely to live in poverty than the general population, which puts them at further disadvantage to accessing needed care and services.

The socioeconomically disadvantaged population is also more limited to affordable housing options which may put them at increased risk for asthma and often do not allow easy access to safe environments for physical activity. Additionally, the stress induced by financial constraints is recognized by key informants for its effect on education, poor health choices among pregnant women, and the social environment in which families live. The resulting health problems in the low-income population include higher rates of chronic disease such as diabetes and asthma. The number of Hawaii residents living in poverty and facing greater health challenges is likely underestimated because federal definitions of poverty do not adjust for the high cost of living in the state.

Cultural and language barriers inhibit effective intervention for the most impacted populations

Because of the strong correlation between poverty and race/ethnicity, some of the groups most impacted by health issues often face cultural barriers to health improvement. Language, including limited English proficiency, and poor health behaviors that are common within a culture are challenges that must be overcome in order to effectively prevent disease. While there are race/ethnicity disparities across nearly every topic covered in this report, key informants specifically cited cultural barriers to care in the areas of diabetes; exercise, nutrition, and weight; heart disease and stroke; immunizations and infectious disease; injury prevention and safety; mental health and mental disorders; respiratory disease; and substance abuse. Race/ethnicity disparities in the areas of cancer; family planning; and oral health suggest that these areas are also influenced by cultural barriers and/or the socioeconomic constraints experienced by some race/ethnic groups. See section 4.1.1 for further discussion on health disparities by race/ethnicity.

Limited access to care results in greater health impacts

The concentration of Hawaii's health services in the City of Honolulu make accessing care more challenging for residents of Neighbor Islands. While some parts of Oahu are also included, federally designated underserved areas and populations cover the entirety of all other islands. There are also federally designated primary care provider shortage areas in parts of Maui and Hawaii Counties, dental care provider shortage areas in Maui County, and mental health care provider shortage areas across all the counties. Key informants also stated that rural communities have lower levels of access to vaccinations, and that there is a need for increased capacity around acute psychiatric care in rural areas. While some services may be difficult to provide in low population density areas, travelling to Honolulu for specialty care such as cancer treatment is expensive and unaffordable for many.

Community health centers and schools are key community assets for effective interventions

Given the difficulty in providing services in Hawaii's rural areas, several key informants recommended focusing on intervention through community health centers. Areas for which this was specifically recommended included family planning, mental health, and oral health. Locally based care has many advantages, including the ability to bring primary care services that are culturally appropriate to communities. Staffing community health centers with residents from the served community offers opportunities for economic advancement and an improved social environment. While Hawaii has many existing community health centers, funding is often a limitation of providing services through these venues.

Health interventions for children and teens can have a two-fold benefit of establishing healthy life-long behaviors among Hawaii's youth, as well as influencing the health of their families. Key informants often recommended interventions that are school-based or involve collaboration with Hawaii schools. School-based clinics can be an avenue to health care that is easily accessible to families, and vaccine clinics in schools increase uptake of immunizations. Childhood obesity can be addressed in school by increasing physical activity time and sports activities, an important step towards reducing future chronic disease. Schools can also play an important role in addressing substance abuse, an increasing problem among teens.

4.1.1 Disparities Highlights

Although the root causes of health disparities are attributable to socioeconomic, race/ethnicity is a correlate for which data is more often available. The topic areas for which each race/ethnic group was noted to have a severe disparity (either by a key informant or for at least one indicator) are listed in Figure 4.1. Note that some race/ethnic categories differ between secondary data sources, and the degree to which disparities could be assessed depend on data availability. A significant finding is that Native Hawaiians and Pacific Islanders are faring worse across more topic areas than any other group. This population also has one of the highest poverty rates in the state.

Figure 4.1: Areas of Disparity for Race/Ethnicity Groups

4.1.2 Identified Data Gaps

There were two topic areas for which so little data was available that a core indicator summary score was not calculated: Disabilities and Older Adults & Aging. Although the population affected by Disabilities was described with data from the American Community Survey, information on the specific needs and challenges of this group is lacking. The health needs of Older Adults can be further described with data from other topics such as tooth loss, immunization rates for adults 65 and older, and age-specific hospitalization rates. However, data describing the social isolation, disability, and care needs faced by this population is lacking as well.

Core indicators for Diabetes and Respiratory Disease were also limited. Both of these areas were further informed by hospitalization rates, but more data would further describe these areas, especially for children. While secondary data for mental health did not seem to adequately describe Hawaii's problems, primary data brought further attention to this critical area that impacts many other health behaviors and outcomes. For Immunizations & Infectious Diseases, little sub-population data is available to examine disparities. And while Oral Health indicators showed that Hawaii adults compare well to the nation, no data could be found for Oral Health among children.

Another area where available data does not fully describe the health needs is with new immigrant and transient populations. Primary data did highlight the populations arriving in Hawaii under the Compact of Free Association and the new challenges this growing group presents to the state's health care system. Due to this population's mobility, marginalized existence, and cultural isolation, traditional public health surveys and population statistics typically do not capture their data and circumstance. However, acute care settings are challenged to provide services and community infrastructure to support the new populations.

4.2 Limitations and Other Considerations

This needs assessment is subject to limitations of the methods used for summarizing core indicators and key informant interview findings. Topic areas to which core indicators were assigned are not truly independent of each other, and the scoring system used could not account for the inherent relationships between health and wellness topics. The number of indicators available for each topic area varied, and while the scoring system numerically accounted for this variation, the impact of a given indicator on the final scoring for a topic area was greater if fewer indicators and/or comparisons were available. Nonetheless, this needs assessment utilized an extensive data set, derived from the best public health data made available by the Hawaii State Department of Health and the Hawaii Health Data Warehouse. By using the local website source for indicator data, available from www.HawaiiHealthMatters.org, the most recent, least aggregated across years, and most detailed race/ethnicity disparity data possible was considered. Race and ethnicity breakout data from this source provides information on the numerous subgroups in Hawaii (Japanese, Filipino, Chinese, Native Hawaiian, Pacific Islander), allowing this report to understand health needs and disparities for groups that together comprise a majority of the population in Hawaii.

Indicators from national data sources had limitations, including combining important race and ethnic groups together and thus masking disparities. Importantly, in assessing poverty and economic measures, data sources did not account for the higher cost of living on the islands, resulting in an underestimation of poverty in Hawaii.

The variability in accuracy and precision of secondary data indicators, as well as the comparisons used, are further limitations. Some indicators, such as those from vital statistics, are based on accurate counts and are more exact. Other indicators which are based on surveys are subject to variability due to sampling error and accuracy of self-reported data. Because of the varying amount of historical data

available for different sources, trend comparisons were not equal between indicators. Additionally, many indicators from surveys conducted in Hawaii, including the Hawaii Health Survey (HHS) and Pregnancy Risk Assessment Monitoring System (PRAMS), could not be compared to a national value or benchmark due to lack of equivalent data. When national comparisons were available, sometimes the indicator was in an area where the nation as a whole is doing very poorly and a favorable comparison for Hawaii did not necessarily reflect good health; examples of this include obesity and physical activity measures. Healthy People 2020 benchmarks were used for comparisons, when available, though some of these can be ambitious targets for communities to meet.

While preventable hospitalization rate indicators provided by HHIC were invaluable for enabling insight into the underlying health of the community for each county, it should also be considered that the variation in rates may reflect geographic differences in access and timeliness of care. Further analysis may be needed to better understand Hawaii's preventable hospitalization patterns.

One challenge in conducting this community health needs assessment was the condensed timeline. All of this work was compressed into a 5½-month time frame, overlapping the winter holidays, which impacted the primary data collection strategy. However, the key public health officials and community health leaders of Hawaii were successfully included in the key informant process (See Appendix C for a full list of key informants interviewed). The online community survey was aimed to further complete the understanding of the local needs in Hawaii, although the limited participation makes it difficult to assess if findings accurately reflect the broader community's perspective. While invaluable data was provided through the primary data collected for this report, a future CHNA process would benefit from a longer time horizon and would allow for expanded involvement and input from the community.

Regardless of the limitations, this report provides a snapshot of the health and quality of life challenges in Hawaii. The needs outlined provide a guide for community benefit planning, but subsequent efforts may be needed to delve deeper into specific areas of need and the most effective methods of intervention. While there are many areas of need, there are also innumerable community assets and a true *aloha* spirit that provide ample foundation for community health improvement activities.

5 Selected Priority Areas

On March 6, 2013, HCI presented the Community Health Needs Assessment findings for Honolulu County to the Straub Clinic and Hospital Community Benefit team. Following the presentation, HCI facilitated a prioritization process whereby the team of eight narrowed down the 20 topic areas of need from the CHNA report to two priorities. These two priorities will be the focus for Straub's implementation strategy planning.

The group used the Nominal Group Planning Process. The group determined the following criteria for selecting priorities:

- Magnitude/severity of problem
- Opportunity to intervene at prevention level
- Alignment with Straub's mission/strengths/programs
- Opportunity for partnership
- Solution could impact multiple problems
- Feasibility of change
- Importance of problem to community

Each member of the community benefit team was given a ballot that listed the 20 topic areas of need highlighted in the CHNA report. Each member cast their vote, selecting three topic areas as the key areas of need to focus community benefit efforts. The team members understood that the selected priorities would become the areas of focus for their implementation strategy planning.

After two rounds of voting and discussion, the top two topic areas selected as priorities were:

1. Access to Health Services
2. Heart Disease & Stroke

HCI then asked for nominations for key stakeholders so that their priorities could be validated and communicated to the larger community. The group nominated the following individuals:

- Loretta Fuddy, Director, Hawaii Department of Health
- Senator Suzie Chun Oakland

HCI conducted these key stakeholder interviews and were able to share and validate the hospital's priorities and learn about partnership opportunities.

Appendix A: HCI Provided Data

About HCI Provided Data

Healthy Communities Institute (HCI), in partnership with the Hawaii Department of Health and the Hawaii Health Data Warehouse, provides demographic and secondary indicator data on health, health determinants, and quality of life topics. Data is typically presented in comparison to the distribution of counties, state average, national average, or Healthy People 2020 targets. Data is primarily derived from state and national public health sources. HCI also provides a database of promising practices from a variety of sources, including the Centers for Disease Control and Prevention.

All of the HCI content is presented in a public web platform that also serves as a publishing tool for components of Community Health Needs Assessments.

Framework for Indicator/Data and Topic Selection

The framework for indicator selection within the Health category is based on the Department of Health and Human Services (DHHS) Healthy People initiative. Healthy People establishes science-based national objectives for improving the health of the nation. The initiative establishes benchmarks every ten years and tracks progress toward these achievable goals. This framework encourages collaboration across sectors and allows communities to track important health and quality of life indicators focusing on general health status, health-related quality of life and wellbeing, determinants of health and disparities.

The Health subcategories are based on the Healthy People framework, and multiple indicators across the health sub-topics that correspond with Healthy People targets have been chosen (based on data availability, reliability and validity from the source).

Indicators in the other categories were selected according to national consensus and feedback from a wide set of advisors, public health officials, health departments, and local stakeholders from various sectors in the community. For example, the education indicators are based on the National Center for Health Research and Statistics and United Way of America, and the standards and goals they set forth to help track educational attainment in the U.S. Economic indicators were selected in conjunction with economic development and chamber of commerce input. All of the selected indicators have gone through a vetting process where HCI's advisory board, as well as stakeholders in communities who have implemented HCI systems, provide feedback to refine the core indicators in order to best reflect local priorities.

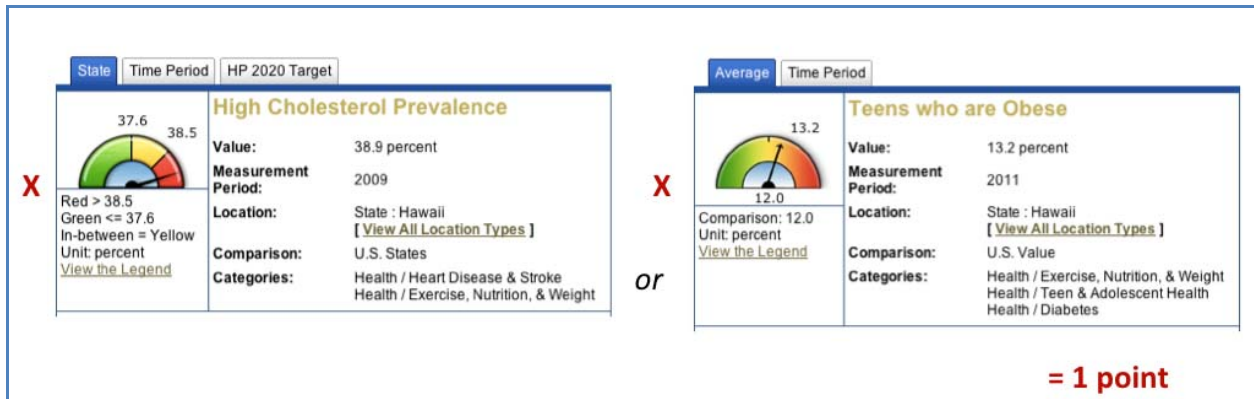

The indicator selection process evolves over time with changing health priorities, new research models and national benchmarks. HCI continues to incorporate models and standards from nationally recognized institutions such as HHS's Healthy People, AHRQ's PQI's, EPA Air Quality standards, National Center for Education Research and Statistics' priorities, United Way, and United States Department of Agriculture's Food Atlas, among many others.

Core Indicator Data Summary: Analytic Approach and Scoring Methodology

As discussed in Section 2.1, the selection of topic areas for primary data collection relied on four types of Core Indicator comparisons: geographic, trend, disparity, and benchmark. A four-point system was used to evaluate each indicator on these four comparison methods, as illustrated in the examples below. Please note the data in this section is presented only to demonstrate the methodology and may not reflect data referenced elsewhere in this report.

Geographic Comparison

The indicator was assigned a point if the value was either in the bottom 50th percentile of U.S. states or worse than the U.S. value. The specific comparison type depended on data availability: a distribution was created if data for other states were comparable; otherwise, the U.S. value was used. In the example indicators below, a state distribution was available for the high cholesterol prevalence indicator, while only a U.S. value comparison was available for the teen obesity indicator. Both of these indicators would receive a geographic comparison point for comparing unfavorably to other states and the U.S., respectively:

Trend Comparison

The indicator was assigned a point if the value was worsening by at least 2.5% on average. In this example of a colon cancer screening indicator, a point would be assigned because the value decreased by 7.9% on average:

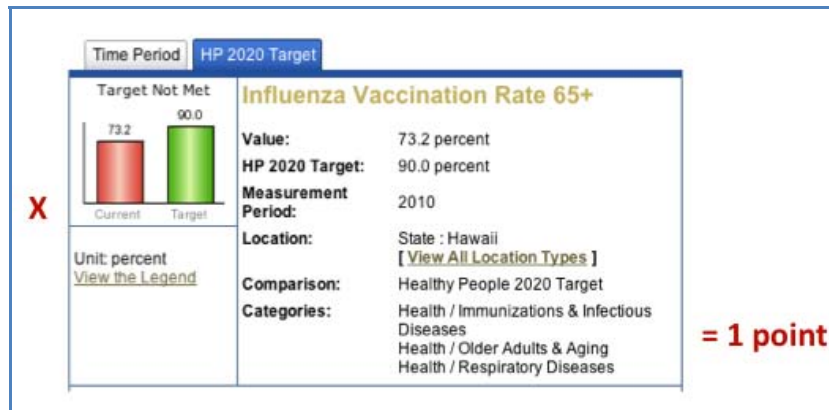

Disparity Analysis

The indicator was assigned a point if there were large disparities among subpopulations. In this Core Indicator analysis, any indicator with a maximum disparity ratio of 4 or greater received a point. This example of an adult smoking indicator would receive a point because its maximum disparity ratio is over 4:

Healthy People 2020 Target Comparison

The indicator was assigned a point if it did not meet a Healthy People 2020 target. In this example of an influenza vaccination indicator, a point would be assigned because the state did not meet the target of 90.0%:

The total earned points and total possible points were tallied for each indicator. In this example of a mammogram history indicator, four points were possible since all four comparisons were available. Out of the four potential points, the indicator earned only one point, for not meeting the Healthy People 2020 target:

Indicator	National Comparison	Trend	Disparity	HP2020 Target	Points / Possible
Mammogram History	√	√	√	X	1/4

X Poor value relative to comparison; point assigned
 √ Value not poor relative to comparison; no point assigned

The total earned points and total possible points were then tallied for all indicators in a topic area to calculate the topic area summary score. In this cancer topic area example, 15 points were earned out of 38 possible points, giving the topic area a summary score of 0.39. These summary scores were then ranked in descending order to help guide the primary data collection process.

Indicator	National Comparison	Trend	Disparity	HP2020 Target	Points / Possible
Mammogram History	√	√	√	X	1/4
Breast Cancer Incidence	X	√	√		1/3
Breast Cancer Death		√	X	√	1/3
Pap Test History		√	√	X	1/3
Cervical Cancer Incidence	X	X	√		2/3
Colon Cancer Screening	√	X	√		1/3
Colorectal Cancer Incidence	X	√	√	X	2/4
Colon Cancer Death Rate		√	X	√	1/3
Liver and Bile Duct Cancer Incidence	X	X	√		2/3
Lung and Bronchus Cancer Incidence	√	√	√		0/3
Melanoma Incidence	X	X	X		3/3
Prostate Cancer Incidence	√	√	√		0/3
Total for Cancer	5/9	4/12	3/12	3/5	15/38

All points earned by indicators in a topic area are divided by total points possible to calculate the topic area's summary score

Cancer Summary Score:
 $15 \div 38 = 0.39$

Core Indicator Data

Most of the core indicator data included in this report can be found on Hawaii Health Matters (<http://www.HawaiiHealthMatters.org/>).

State of Hawaii

Detailed Explanation of Contents

Topic Area	Health/Quality of Life topic area
Score	Score calculated as proportion of poor comparisons for all indicators within topic (range 0-1)
Indicator	Measure of a specific issue within a topic area
Value	Most recent value available, with period of measurement
National Value	Median U.S. State value (* denotes U.S. average value)
% Change per Year	Percent change per year (calculated using line of best fit for all values available), with earliest period of measurement
Race Disparity Ratio	Ratio between highest and lowest value for a specific race/ethnic group
Gender Disparity Ratio	Ratio between gender-specific values
Age Disparity Ratio	Ratio between highest and lowest value for a specific age group
HP2020 Target	Healthy People 2020 Target for indicator
Sub-populations in greatest need	Race, gender, or age specific sub-populations with a value greater than average, with sub-population value. Only worst age group is included.
Source of Data	Source of indicator data
Unit of Measure	Units of measure for indicator data

Red text indicates "poor" comparison that contributed to topic area score

Please note that availability of comparisons and sub-population categories vary by indicator and data source

All data is presented in the following format:

Topic Area							Score
Indicator	Value (Year)	National Value	% Change per Year (baseline year)	Race Disparity Ratio	Gender Disparity Ratio	Age Disparity Ratio	HP2020 Target
Sub-populations in greatest need (value)

Appendix B: Hospitalization Data

Hospitalization Rates

Rates were provided by HHIC, and are defined by the Agency for Healthcare Research and Quality (AHRQ) as a set of measures that can be used to identify quality of outpatient care that can potentially prevent the need for hospitalization. Rates are risk-adjusted based on the Healthcare Cost and Utilization Project's State Inpatient Databases. Please see http://qualityindicators.ahrq.gov/Modules/pqi_resources.aspx for a complete definition of indicators. Because the area of mental health was not well represented in the Core Indicator Summary, HHIC also provided unadjusted rates of hospitalization for any mental health-related primary diagnosis.

For all rates, values were suppressed if based on fewer than 10 cases. Population estimates are based on the U.S. Census Bureau, Population Division, Intercensal Estimates of the Resident Population for Counties of Hawaii. Population estimates by race were provided by the Hawaii State Department of Health, Office of Health Status Monitoring, Hawaii Health Survey 2009-2010.

The tables below include risk-adjusted hospitalization rates with 95% confidence intervals for the State of Hawaii and counties for 2009, 2010, and 2011. Unadjusted rates by age, gender, and race are for 2011 only. All mental health hospitalization rates are unadjusted. Use caution when comparing unadjusted rates, as they may represent populations of differing age distribution.

	Counties					
	Hawaii State		Hawaii	Honolulu	Kauai	Mauai
	Cases	Rate (95% CI)	Rate (95% CI)	Rate (95% CI)	Rate (95% CI)	Rate (95% CI)
